3.0%

Estimated Deaths in 2018

10,030

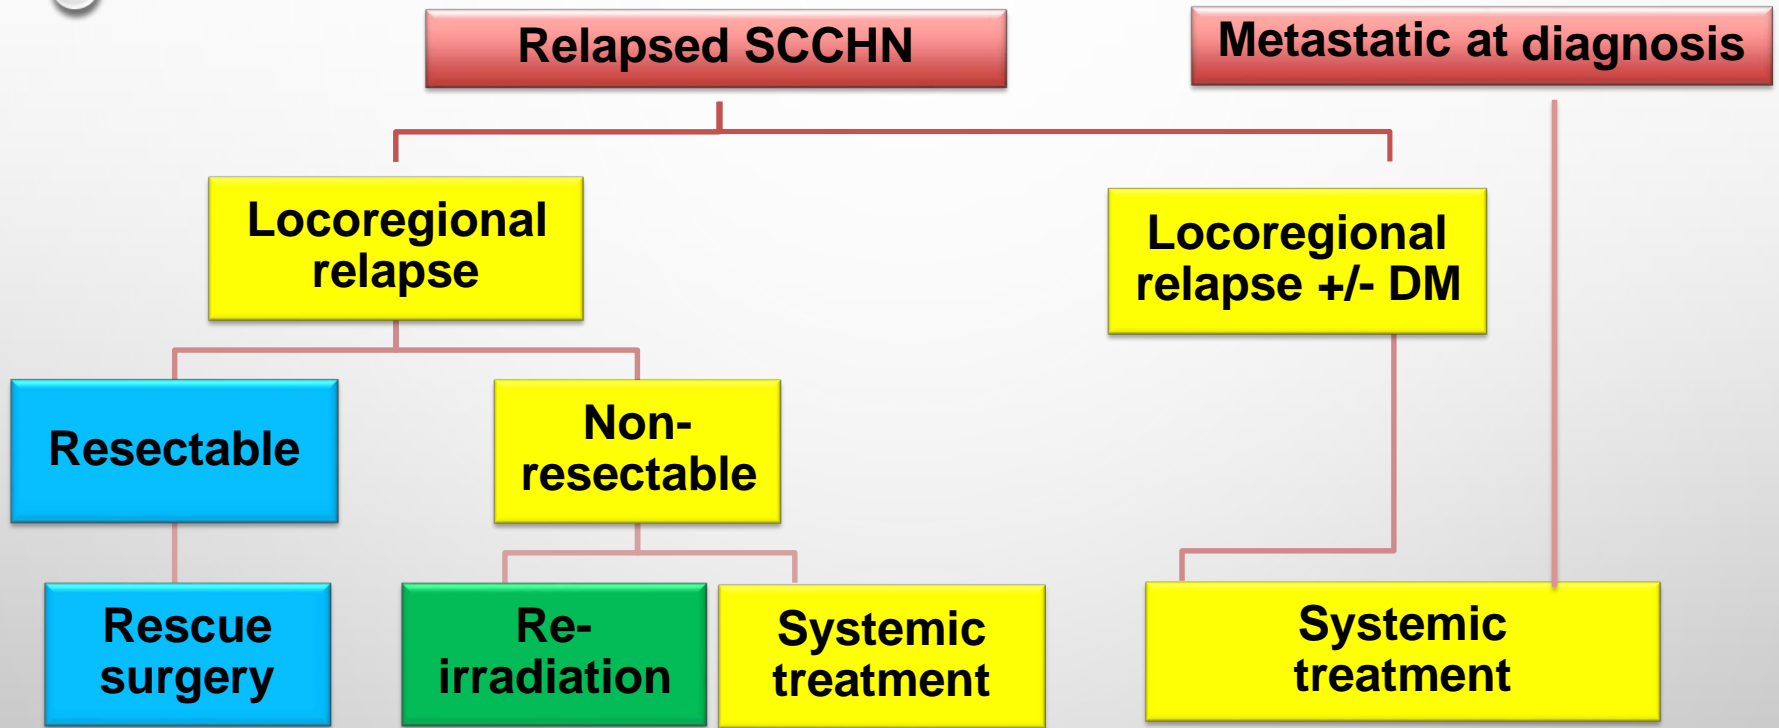

% of All Cancer Deaths

1.6%

# Some Statistics

# Treatment Options for R/M SCCHN

DM, distant mtastases; R/M, recurrent and/or metastatic

# Factors Associated With Poor Outcome

## Patient Related

Poor performance status

Comorbidities

Poor cognitive status

Persistent use of carcinogens (smoking, alcohol)

## Disease Related

Tumor sites (primary and recurrences)

Advanced state

Great volume disease

History of aggressive disease

Paraneoplastic hypercalcemia

## Treatment Related

Previous treatments

Time to tumor progression

Poor or null response to previous treatment

# SCCHN R/M Not Suitable for Rescue Surgery or Re-Irradiation

- **Platinum-sensitive patients:**
  - Recurrence after a combined treatment that included platinum with a PFS of more than 6 months
  - Platinum-naïve patients with R/M disease
- **Platinum-refractory patients:**
  - Recurrence after a combined treatment that included platinum with a PFS of less than 6 months
  - Patients with progressive disease during a platinum-containing treatment for R/M disease

# EXTREME Trial: Overall Survival 5-Year Follow-Up

Vermorken JB, et al. *N Engl J Med.* 2008;359(11):1116–1127. Vermorken JB, et al. *J Clin Oncol.* 2014;32(Suppl): Abstract 6021.

## **Cisplatin-Refractory R/M SCCHN**

- **Survival is very poor ( $\leq 6$  months)**
- **Conventional anticancer treatments have not been effective in increasing survival**
- **Immunotherapy arises as a new treatment option in this setting**

# SCCHN May Benefit From Immune System–Targeted Treatments

- High mutational burden due to tobacco usage, and expression of HPV-associated oncogenes, may contribute to immunogenicity in SCCHN tumors
- In HNSCC, tumors create a highly immunosuppressive microenvironment and can evade immune detection by exploiting inhibitory immune checkpoints such as PD-1/PD-L1

**Our goal is to:  
Break Tolerance!**

## Immune Surveillance:

- Immune system recognizes malignant cells

## Immune Escape:

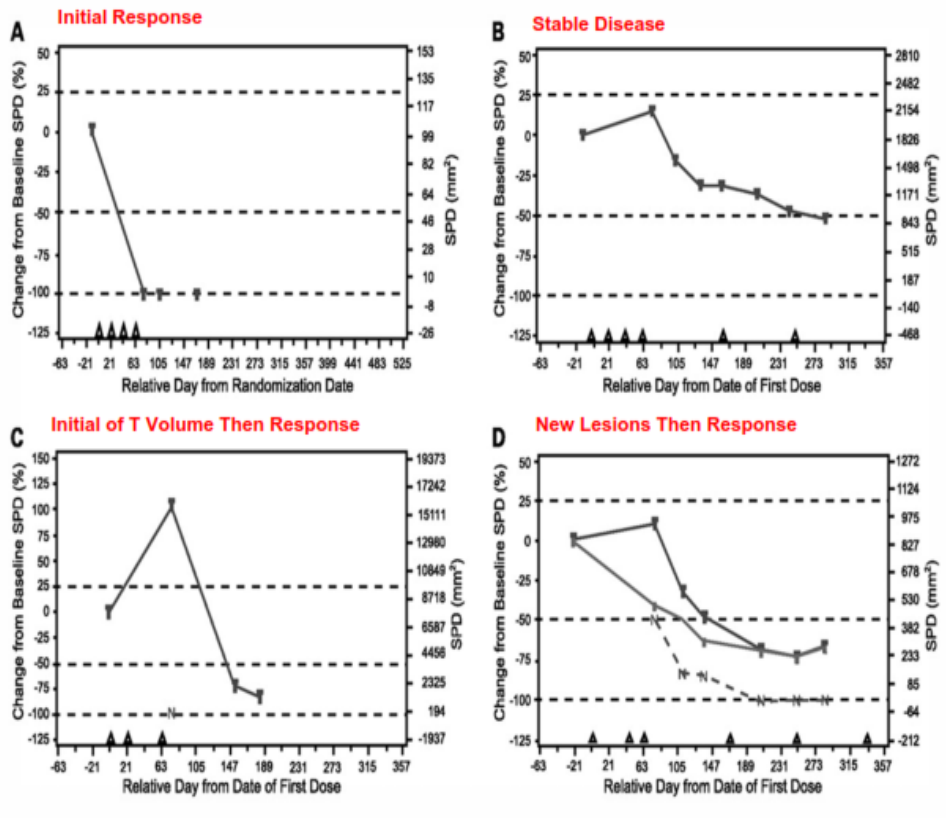

1. **Antigen Presentation:** Loss of Antigen (Immune-editing), HLA ↓
2. **Immune Checkpoints:** PD1- PD-L1, CTLA4, TIM3
3. **Cytokines:** TGF-β, IL-4, IL-6
4. **Immunosuppressive ME:** IDO
5. **Cellular Immune Escape:** T-reas, M2 macrophages, MDSCs
6. **T-cell Anergy**

Blocking interaction PD-1 with PD-L1/2 may reactivate immune surveillance and elicit antitumor activity

# What Is Unique About Immunotherapy?

## Atypical patterns of response

Wolchok JD, et al. *Clin Cancer Res.* 2009;15(23):7412-7420.

## Immune-related toxicity

Autoimmune/inflammatory AEs may affect any organ

Champiat S, et al. *Annals of Oncol.* 2016;27(4):559-574.

## Immune-Mediated Side Effects

- **Can arise every time**
- **Even after end of therapy!**
- **ALL** organ systems might be involved

Thompson in collaboration with the National Comprehensive Cancer Network

# Management of irAEs: General Principles

## Early Recognition and Management is Essential

Severity— CTCAE grade	Ambulatory versus inpatient care	Corticosteroids	Other immunosuppressive drugs	Immunotherapy
1	Ambulatory	Not recommended	Not recommended	Continue
2	Ambulatory	Topical steroids or Systemic steroids oral 0.5–1 mg/kg/day	Not recommended	Suspend temporarily <sup>a</sup>
3	Hospitalization	Systemic steroids Oral or i.v. 1–2 mg/kg/day for 3 days then reduce to 1 mg/kg/day	To be considered for patients with unresolved symptoms after 3–5 days of steroid course Organ Specialist referral advised	Suspend and discuss resumption based on risk/benefit ratio with patient
4	Hospitalization consider intensive care unit	Systemic steroids i.v. methylprednisolone 1–2 mg/kg/day for 3 days then reduce to 1 mg/kg/day	To be considered for patients with unresolved symptoms after 3–5 days of steroid course Organ specialist referral advised	Discontinue permanently

Some dysimmune toxicities may follow a specific management: this has to be discussed with the organ specialist.  
<sup>a</sup>Outside skin or endocrine disorders where immunotherapy can be maintained.

# Targeting the PD1/PDL1 Pathway in HNSCC

	IO agent	N	Design	Population
Anti-PD-1	<b>Nivolumab (Checkmate 141)<sup>1</sup></b>	<b>240</b>	<b>Phase III</b>	<b>Unselected for PD-L1, platinum refractory based therapy)</b>

# BACKGROUND

- Long-term prognosis for patients with recurrent or metastatic (R/M) squamous cell carcinoma of the head and neck (SCCHN) post-platinum therapy has historically been poor, with a median overall survival (OS) of <6 months<sup>1</sup>
- Nivolumab demonstrated significant OS benefit and better tolerability vs investigator's choice (IC) in CheckMate 141, a randomized phase 3 trial:
  - Trial stopped early at the interim (primary) analysis due to statistically significant OS benefit
    - **Median OS: 7.5 vs 5.1 mo**; HR = 0.70 (97.73% CI: 0.51, 0.96);  $P = 0.01$ <sup>2</sup>
  - At minimum follow-up of 1-year, prolonged OS benefit was noted
    - **Median OS: 7.7 vs 5.1 mo**; HR = 0.71 (95% CI: 0.55, 0.90)<sup>3</sup>
  - Nivolumab was better tolerated, with stabilized quality of life, compared with IC (methotrexate, docetaxel, cetuximab)<sup>2-4</sup>
- At AACR 2018 (**2-year follow-up**) data in patients with R/M SCCHN post-platinum therapy from CheckMate 141

1. Saloura V, et al. *Cancer Chemother Pharmacol* 2014;73:1227–1239. 2. Ferris RL, et al. *N Engl J Med* 2016;375:1856–1867. 3. Gillison ML, et al. *The Oncologist* 2018; In Press. 4. Harrington KJ, et al. *Lancet Oncol* 2017;18:1104–1115.

# CHECKMATE 141 STUDY DESIGN

- Randomized, open-label, phase 3 trial (NCT02105636)

- Data cutoff: September 2017 (minimum follow-up of 24.2 months)

DOR = duration of response; HPV = human papillomavirus; IV = intravenous; OPC = oropharyngeal cancer; ORR = objective response rate; OS = overall survival; PD-L1 = programmed death ligand 1; PFS = progression-free survival; QoL = quality of life

# BASELINE CHARACTERISTICS

- Baseline characteristics were generally balanced between treatment arms, as previously reported

Patients, n (%)	Nivolumab (n = 240)	IC (n = 121)
<b>Tumor PD-L1 expression<sup>a</sup></b>		
≥1% (PD-L1 expressors)	96 (40.0)	63 (52.1)
<1% (PD-L1 non-expressors)	76 (31.7)	40 (33.1)
Not quantifiable <sup>b</sup>	68 (28.3)	18 (14.9)
<b>HPV status<sup>c</sup></b>		
Positive	64 (26.7)	29 (24.0)
Negative	56 (23.3)	37 (30.6)
Unknown/not reported	120 (50.0)	55 (45.5)

<sup>a</sup>PD-L1 status was determined using the Dako PD-L1 IHC 28-8 pharmDx test

<sup>b</sup>Tumor not present, sample not provided, or sample could not be processed

<sup>c</sup>HPV status was assessed using p16 immunohistochemical testing; required only for patients with OPC

# SUSTAINED OS BENEFIT IN THE OVERALL (ITT) POPULATION

- Nivolumab reduced the risk of death by 32% vs IC
- The 24-month OS rate was nearly tripled with nivolumab compared with IC

Symbols represent censored observations. ITT = intent-to-treat; Nivo, nivolumab

# OS BENEFIT ACROSS PD-L1 EXPRESSORS AND NON-EXPRESSORS

- OS rates at 18, 24, and 30 months were similar in both groups
  - PD-L1 expressors: nivolumab continued to provide OS benefit, with 45% reduction in risk of death vs IC
  - PD-L1 non-expressors: nivolumab resulted in 27% reduction in risk of death vs IC

**PD-L1 Expressors (≥1%)**

No. at risk	Months													
	0	3	6	9	12	15	18	21	24	27	30	33	36	39
<b>Nivo</b>	96	74	59	42	30	25	22	19	16	11	8	5	1	0
<b>IC</b>	63	45	24	14	10	6	4	3	2	2	0	0	0	0

**PD-L1 Non-Expressors (<1%)**

No. at risk	Months													
	0	3	6	9	12	15	18	21	24	27	30	33	36	39

# OS BY HPV STATUS

- Nivolumab demonstrated survival benefit in patients with HPV-positive and HPV-negative tumors, with comparable HRs for risk of death vs IC

### HPV-Positive

	Median OS (95% CI), mo	HR (95% CI)
<b>Nivo</b>	9.1 (6.5, 11.8)	0.60 (0.37, 0.97)
<b>IC</b>	4.4 (3.0, 9.8)	

No. at risk	Months													
	0	3	6	9	12	15	18	21	24	27	30	33	36	39
<b>Nivo</b>	64	50	40	31	23	17	16	13	12	11	7	6	3	0
<b>IC</b>	29	20	13	9	8	4	2	1	1	1	1	1	0	0

### HPV-Negative

	Median OS (95% CI), mo	HR (95% CI)
<b>Nivo</b>	7.7 (4.8, 13.0)	0.59 (0.38, 0.92)
<b>IC</b>	6.5 (3.9, 8.7)	

No. at risk	Months													
	0	3	6	9	12	15	18	21	24	27	30	33	36	39
<b>Nivo</b>	56	38	34	24	22	19	16	15	13	8	4	2	0	0
<b>IC</b>	37	28	18	11	5	4	4	3	2	1	0	0	0	0

<sup>a</sup>HPV testing was required only for patients with OPC; symbols represent censored observations

# OVERALL SURVIVAL BY AGE

# SUBSEQUENT THERAPIES AMONG PATIENTS WHO DISCONTINUED TREATMENT

- Nivolumab continued to improve in OS vs IC in spite of subsequent immunotherapy in 10.1% of patients in the IC arm

Patients, n (%)	Nivolumab (n = 228)	IC (n = 109)
<b>Any therapy<sup>a</sup></b>	91 (39.9)	43 (39.4)
<b>Radiotherapy</b>	30 (13.2)	14 (12.8)
<b>Surgery</b>	2 (0.9)	3 (2.8)
<b>Systemic therapy</b>	82 (36.0)	36 (33.0)
Taxanes	35 (15.4)	11 (10.1)
Monoclonal antibodies (bevacizumab, cetuximab)	31 (13.6)	8 (7.3)
Other – approved agents	31 (13.6)	12 (11.0)
Folic acid analogue	22 (9.6)	7 (6.4)
Platinum-based chemotherapy	16 (7.0)	11 (10.1)
Other – experimental agents	15 (6.6)	3 (2.8)
Immunotherapy (nivolumab, pembrolizumab, durvalumab, urelumab)	12 (5.3)	11 (10.1)
PD-1/PD-L1 inhibitors (nivolumab, pembrolizumab, durvalumab)	9 (3.9)	10 (9.2)
Unassigned	1 (0.4)	0

<sup>a</sup>Patients may have received more than 1 type of subsequent therapy, which was defined as non-study anticancer therapy started on or after first dosing date (or randomization date, if patient was not treated)

# TUMOR RESPONSE

- In the nivolumab arm, complete responses were observed in both PD-L1 expressors and PD-L1 non-expressors
  - Seven complete responders (2 PD-L1 expressors, 2 PD-L1 non-expressors, and 3 with no data on tumor PD-L1 expression)
  - One patient had a partial response, which later converted to a complete response

	<b>Nivolumab (n = 240)</b>	<b>IC (n = 121)</b>
<b>ORR, % (95% CI)</b>	13.3 (9.3, 18.3)	5.8 (2.4, 11.6)
<b>Time to response, median (range), months</b>	2.1 (1.8 to 7.4)	2.0 (1.9 to 4.6)
<b>Duration of response, median (range), months</b>	9.7 (2.8 to 32.8+)	4.0 (1.5+ to 11.3)

# TREATMENT-RELATED ADVERSE EVENTS

- The safety profile of nivolumab remained consistent with previous analyses,<sup>1,2</sup> and manageable
  - Fewer grade 3–4 events in the nivolumab arm vs the IC arm
  - No new safety signals were reported
- The incidence of serious TRAEs was lower in the nivolumab arm (7.2%) vs the IC arm (15.3%)
- Rates of death due to drug toxicity remained unchanged from the primary analysis<sup>1</sup>

	Nivolumab (n = 236)		IC (n = 111)	
	Any grade	Grade 3–4	Any grade	Grade 3–4
<b>Any TRAE, n(%)</b>	146 (61.9)	36 (15.3)	88 (79.3)	41 (36.9)
<b>TRAEs in ≥15% of patients, n(%)</b>				
Fatigue	37 (15.7)	5 (2.1)	20 (18.0)	3 (2.7)
Nausea	22 (9.3)	0	23 (20.7)	1 (0.9)
Anemia	12 (5.1)	3 (1.3)	19 (17.1)	6 (5.4)
Asthenia	10 (4.2)	1 (0.4)	17 (15.3)	2 (1.8)

1. Ferris RL, et al. *N Engl J Med* 2016;375:1856–1867. 2. Gillison ML, et al. *The Oncologist* 2018; In Press.  
TRAE = treatment-related adverse event

# CONCLUSIONS

- Nivolumab is the only immunotherapy to significantly improve OS vs IC in patients with R/M SCCHN post-platinum therapy, in the primary analysis of a randomized, phase 3 study (CheckMate 141)
  - Primary analysis: HR = 0.70 (97.73% CI: 0.51, 0.96);  $P = 0.01$
  - 2-year follow-up: HR = 0.68 (95% CI: 0.54, 0.86)
- With long-term (2-year) follow-up, nivolumab demonstrated prolonged OS benefit compared with IC in the overall population with
  - Efficacy across PD-L1 expressors and non-expressors
  - Efficacy regardless of tumor HPV status
  - A favorable safety profile compared with IC maintained; no new safety signals observed
  - No observed differences in baseline characteristics or safety profile among long-term survivors in the nivolumab arm compared with the overall nivolumab population
- Nivolumab is an established therapeutic option in R/M SCCHN post-platinum therapy, with demonstrated long-term benefits in OS and safety compared with monotherapy options

**UPDATED SURVIVAL RESULTS OF

# Phase III KEYNOTE-040 Study

## Key Eligibility Criteria

- SCC of the oral cavity, oropharynx, hypopharynx, or larynx
- PD after platinum-containing regimen for R/M HNSCC or recurrence or PD within 3-6 mo of multimodal therapy using platinum<sup>a</sup>
- ECOG PS 0 or 1
- Known p16 status (oropharynx)<sup>b</sup>
- Tissue sample<sup>c</sup> for PD-L1 assessment<sup>d</sup>

## Stratification Factors

- ECOG PS (0 vs 1)
- p16 status<sup>b</sup> (positive vs negative)
- PD-L1 TPS<sup>d</sup> ( $\geq 50\%$  vs  $< 50\%$ )

R  
1:1

Pembrolizumab  
200 mg IV q3w  
for 2 y

Methotrexate 40 mg/m<sup>2</sup> q w<sup>e</sup>  
OR  
Docetaxel 75 mg/m<sup>2</sup> q3w  
OR  
Cetuximab 250 mg/m<sup>2</sup> qw<sup>f</sup>

- Clinically stable patients with radiologic PD could continue treatment until imaging performed  $\geq 4$  wk later confirmed PD
- Crossover not permitted

<sup>a</sup>Limit of 2 prior therapies for R/M HNSCC. <sup>b</sup>Assessed using the CINtec p16 Histology assay (Ventana); cutpoint for positivity = 70%. <sup>c</sup>Newly collected preferred. <sup>d</sup>Assessed using the PD-L1 IHC 22C3 pharmDx assay. TPS, tumor proportion score = % of tumor cells with membranous PD-L1 expression. <sup>e</sup>Could be increased to 60 mg/m<sup>2</sup> qw in the absence of toxicity. <sup>f</sup>Following a loading dose of 400 mg/m<sup>2</sup>.

# KEYNOTE – 040: PRIMARY AND UPDATED ANALYSES

- Primary analysis presented at ESMO 2017
  - Prespecified significance boundary:  $P = 0.0175$
  - Data cutoff date: May 15, 2017
  - No. of Death: 377 (data outstanding for 11 patients)
  - OS: HR 0.81 (95% CI 0.66-0.99),  $P = 0.02024$
- Updated analysis
  - Same data cutoff date: May 15, 2017 (i.e., update is without extending f/u duration)
  - Full acquisition of survival status, including the 11 pts previously outstanding
  - No. of death after acquisition of survival status: 388

# KEYNOTE – 040: BASELINE CHARACTERISTICS

Nausea	12 (4.9)	0	29 (12.4)	1 (0.4)
Mucosal inflammation	9 (3.7)	1 (0.4)	30 (12.8)	5 (2.1)
Stomatitis	6 (2.4)	1 (0.4)	28 (12.0)	11 (4.7)
Neutrophil count decreased	3 (1.2)	1 (0.4)	25 (10.7)	20 (8.5)
Alopecia	1 (0.4)	0	25 (10.7)	0

AEs did not change in updated analysis. Relationship to treatment was determined by the investigator.  
Data cutoff date: May 15, 2017.

## SUMMARY

- After all survival data analyzed using the same data cutoff date and comparing with the primary analysis:
  - HR for OS decreased from 0.81 to 0.80
  - P-value for OS decreased from 0.02024 to 0.0161
  - Better treatment effect in patients with PDL1 expressing tumors
  - Apparent effect of immune checkpoint inhibitors in SOC arm after failure of SOC

# BACKGROUND

- RECIST 1.1 criteria assumed that early tumor growth indicated progressive disease and failure of cytotoxic agents
  - Novel response patterns observed with immunotherapeutic agents have indicated that clinical activity may not be properly interpreted using RECIST 1.1 criteria
  - Tumor lesions may appear to increase in size due to immune and inflammatory cell infiltration, with a delayed clinical response
  - Benefits with continued nivolumab treatment beyond RECIST-defined progression have been reported in some patients with melanoma, non-small cell lung cancer, and renal cell carcinoma
- This is an updated analysis of nivolumab treatment beyond first disease progression as well as correlative biomarkers in CheckMate 141

PD-1 = programmed death-1; RECIST = Response Evaluation Criteria in Solid Tumors

IC = investigator's choice  
 Gillison ML, et al. *J Clin Oncol* 2017;35(suppl): abstract 6019.

# TREATMENT BEYOND PROGRESSION SUBGROUPS

- Treatment beyond first RECIST 1.1-defined progression was permitted in the nivolumab arm based on the following predefined, protocol-specified criteria:
  - Investigator-assessed clinical benefit
  - No rapid disease progression
  - Tolerance of nivolumab
  - Stable performance status
  - No delay of an imminent intervention to prevent serious complications of disease progression
  - Provided informed consent prior to receiving any additional nivolumab treatment

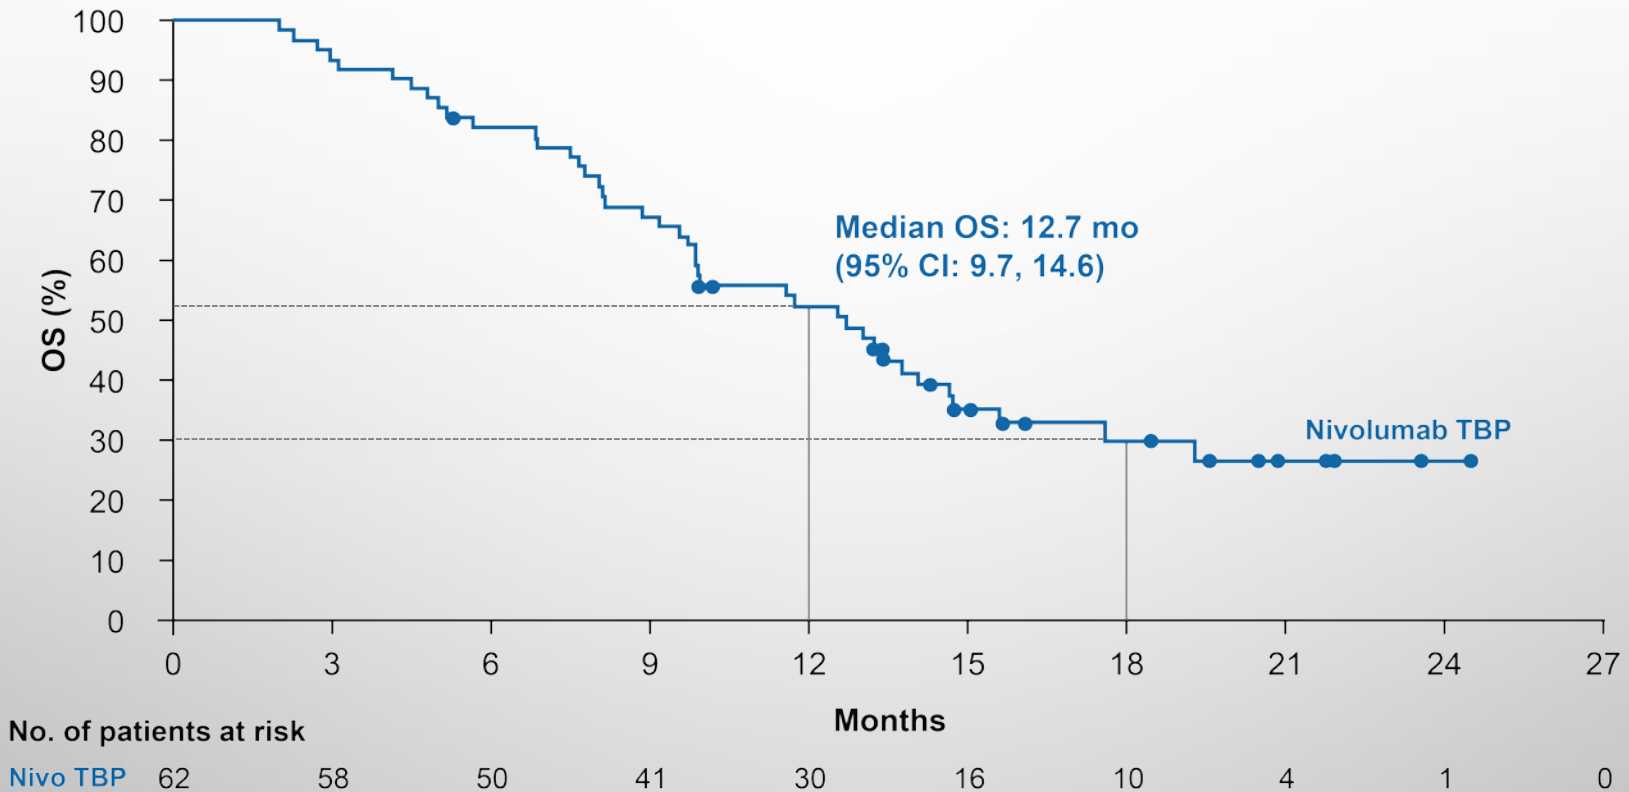

<sup>a</sup>Includes patients who were not treated, those without progression, and those who died or discontinued without a tumor assessment to determine progression

# CHARACTERISTICS OF PATIENTS AT FIRST PROGRESSION

	Treated beyond progression (n = 62)	Not treated beyond progression (n = 84)
<b>ECOG PS, n (%)</b>		
0	22 (35.5)	11 (13.1)
1	40 (64.5)	32 (38.1)
2	0	7 (8.3)
Not recorded	0	34 (40.5)
<b>Type of RECIST progression, n (%)</b>		
Target lesion	38 (61.3)	47 (55.9)
New lesion	3 (4.8)	4 (4.8)
Both	21 (33.9)	33 (39.3)

# OVERALL SURVIVAL, PATIENTS TREATED BEYOND PROGRESSION

# TUMOR REDUCTION IN PATIENTS TREATED BEYOND PROGRESSION

# SAFETY

	Treated beyond progression (n = 62)		Not treated beyond progression (n = 84)	
	Any grade	Grade 3–4	Any grade	Grade 3–4
<b>Any TRAE, n (%)<sup>a</sup></b>	48 (77.4)	9 (14.5)	51 (60.7)	12 (14.3)
<b>TRAEs in &gt;10% of patients, n (%)</b>				
Fatigue	10 (16.1)	1 (1.6)	17 (20.2)	2 (2.4)
Rash	10 (16.1)	0	6 (7.1)	0
Pruritus	9 (14.5)	0	3 (3.6)	0
Anemia	3 (4.8)	1 (1.6)	9 (10.7)	2 (2.4)
Decreased appetite	3 (4.8)	0	10 (11.9)	0
<b>Select TRAEs, n (%)</b>				
Skin	19 (30.6)	0	10 (11.9)	0
Endocrine	8 (12.9)	0	8 (9.5)	0
Gastrointestinal	6 (9.7)	0	8 (9.5)	1 (1.2)
Hepatic	3 (4.8)	0	2 (2.4)	1 (1.2)
Pulmonary	2 (3.2)	0	3 (3.6)	1 (1.2)
Hypersensitivity/infusion reaction	1 (1.6)	0	1 (1.2)	0
Renal	1 (1.6)	0	0	0

- Frequencies of grade 3–4 TRAEs were similar in both subgroups

<sup>a</sup>Events reported between first dose and 30 days after last dose of study therapy  
TRAEs = treatment-related adverse events

## CONCLUSIONS

- Nivolumab treatment beyond progression in patients with R/M SCCHN showed:
  - Evidence of subsequent tumor reduction in 24% of patients (15/62)
  - Median OS of 12.7 months
  - No increase in safety signals
- Treatment beyond progression with nivolumab can be considered in select patients with R/M SCCHN

# SCCHN: PD-L1/PD-1 Plus CRT

## JAVELIN HEAD AND NECK 100

### LEAD-IN

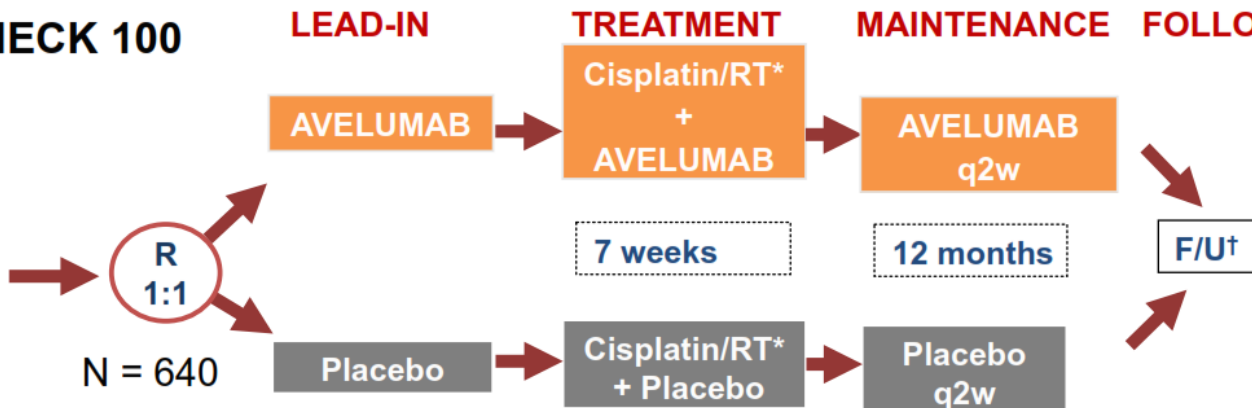

### TREATMENT

### MAINTENANCE

### FOLLOW-UP

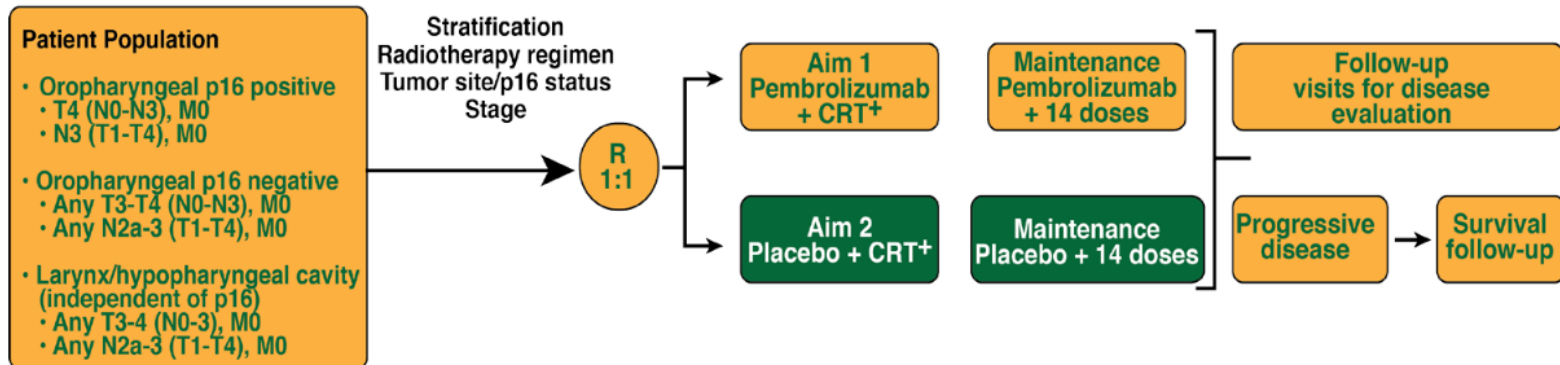

**Eligibility criteria:**

- LA SCCHN
- HPV+ AND HPV-
  - HPV- STAGE III, IVA, IVB
  - HPV+ T4/N2C/N3

## KEYNOTE-412

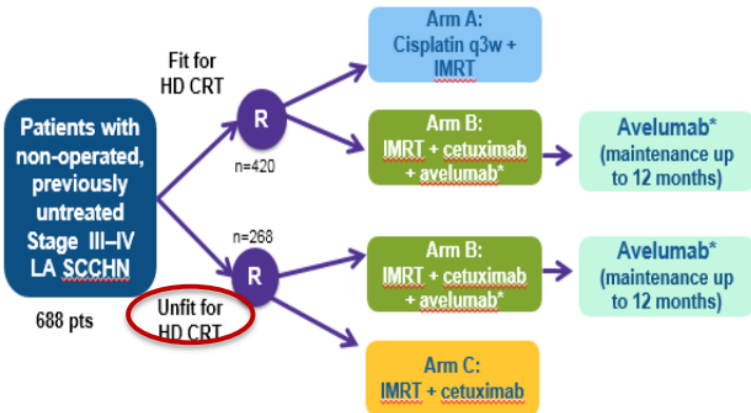

Local testing for p16\*\*

\*\* Expression of P16 is highly correlated with HPV in oropharyngeal cancer. Tumors outside the oropharynx are considered HPV- regardless of results of p16 staining.  
 + Chemotherapy: cisplatin 100 mg/m<sup>2</sup> x 3; RT: accelerated fractionation 200 cGy/6 per week, standard fractionation 200 cGy/5 per week

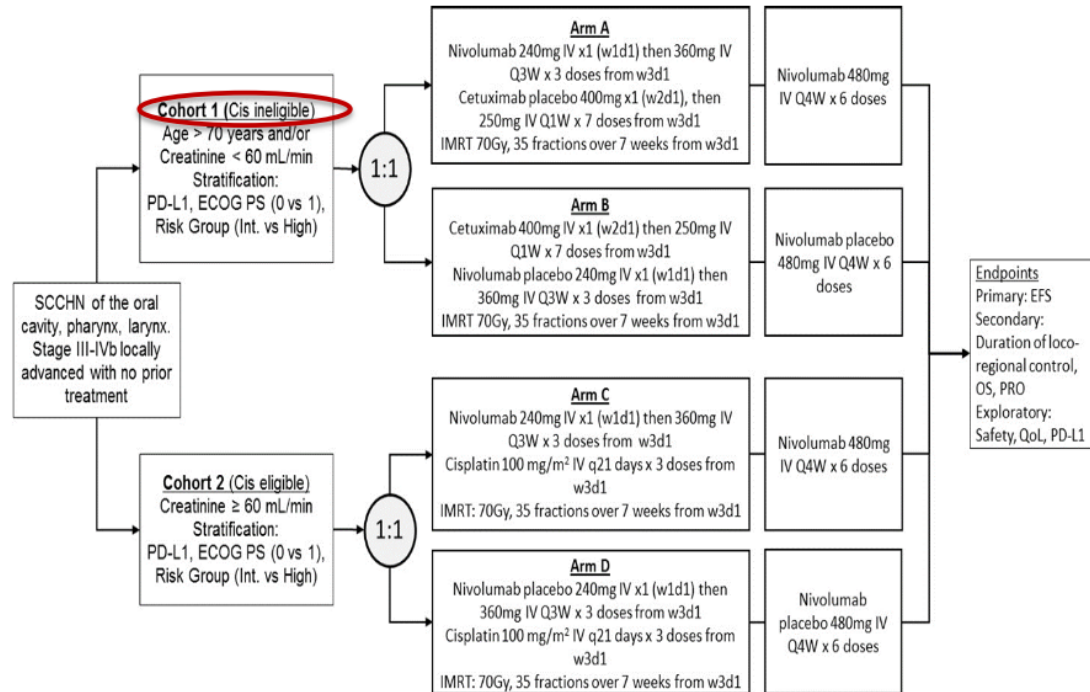

# SCCHN: PD-L1/PD-1 Plus Cetuximab + RT

## REACH (NCT02999087)

Primary endpoint: PFS

## NCT03349710

Role of neoadjuvant/adjuvant immunotherapy remains to be seen

# Ongoing Phase III Studies With Immune Checkpoint Inhibitors in First-Line R/M HNSCC vs Standard of Care

Trial Name (NCT #)	Immunotherapy Agent(s) in Study	Phase	Population	Treatment Arms
<b>CheckMate 651</b> (NCT02741570)	Nivolumab, Ipilimumab	III		Nivolumab + Ipilimumab vs <b>EXTREME</b>
<b>KEYNOTE-048</b> (NCT02358031) completed accrual	Pembrolizumab	III	Previously untreated R/M HNSCC, ≥6 months since last dose of platinum	Pembrolizumab vs Pembrolizumab + Platinum/5FU vs <b>EXTREME</b>
<b>KESTREL</b> (NCT02551159) completed accrual	Durvalumab Tremelimumab	III		Durvalumab vs Durvalumab + tremelimumab vs <b>EXTREME</b>

# Key Take-Home Messages

- **EXTREME regimen (platinum/5FU/cetuximab → cetuximab) is standard first-line treatment for R/M HNSCC, recommended by international guidelines**
- **Nivolumab and pembrolizumab are new standard-of-care options for patients with R/M HNSCC after platinum-based therapy**
  - In asymptomatic patients with no rapid progression, immune checkpoint can be continued until further radiographic assessment in 8 weeks
- **PD-L1 can not be used as a biomarker in SCCHN**
- **PD-1/PD-L1 inhibitors are in general well tolerated, but irAEs can develop; early recognition and management are important**
- **Several trials are ongoing investigating immunotherapy alone and in combinations in first-line therapy of R/M HNSCC**
