ADT alone	455 (2)	449 (8)	435 (19)	276 (13)	63						

Should every newly diagnosed metastatic prostate cancer patient receive abiraterone or docetaxel?

Is one better than the other?

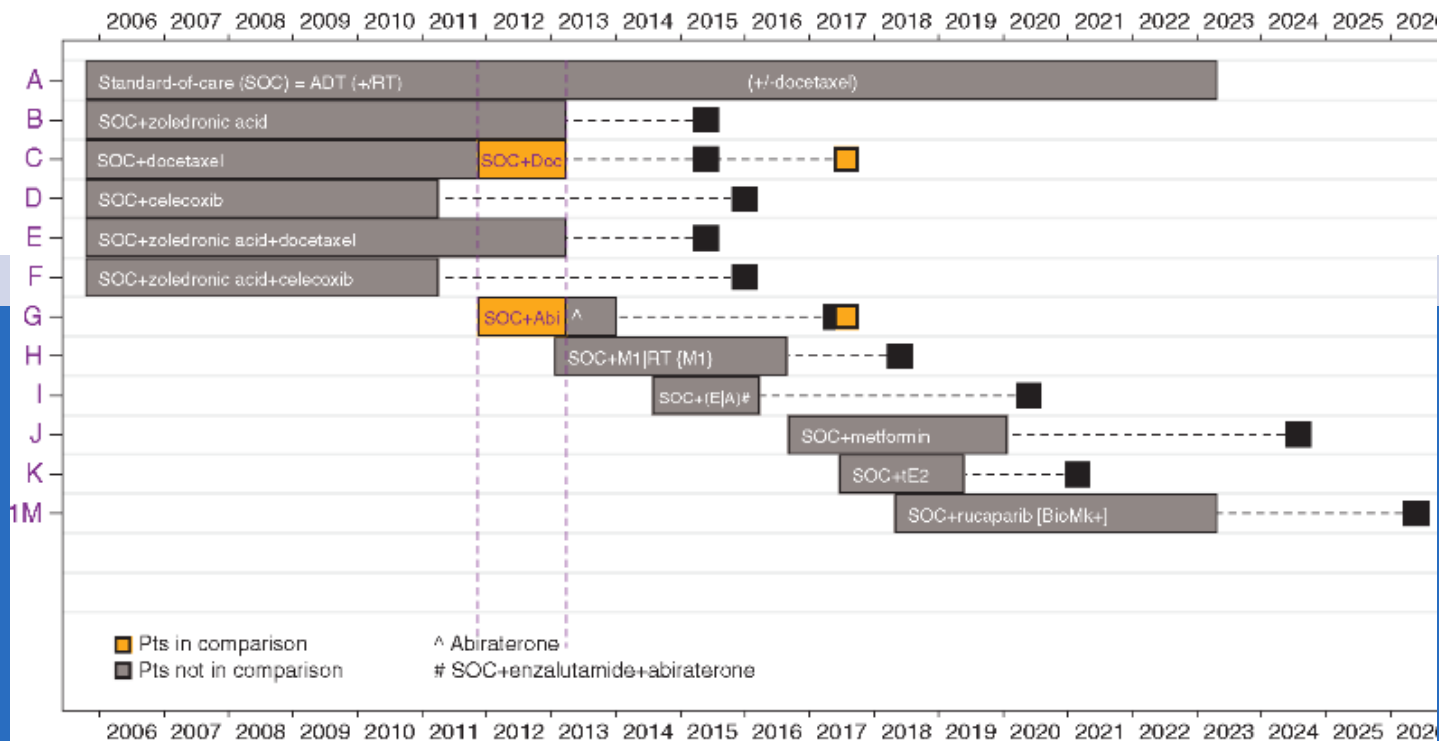

Should we give both?

Sydes MR et al. Ann
Oncol 2018; 29:1235-48

PAM50 Clustering and Clinical Outcomes in Prostate Cancer A, The PAM50 genes cluster prostate cancer samples into 3 subtypes, luminal A (LumA), luminal B (LumB), and basal, in the pooled prostate cancer cohorts (Mayo Clinic I and II, Cleveland Clinic, Thomas Jefferson University, Johns Hopkins University, and Durham Veterans Affairs) using hierarchical clustering of the genes. Each column represents a patient sample, and each row represents a gene. B, Kaplan-Meier curves showing that the PAM50 clusters risk stratify biochemical recurrence-free survival, distant metastasis-free survival, prostate cancer-specific survival, and overall survival.

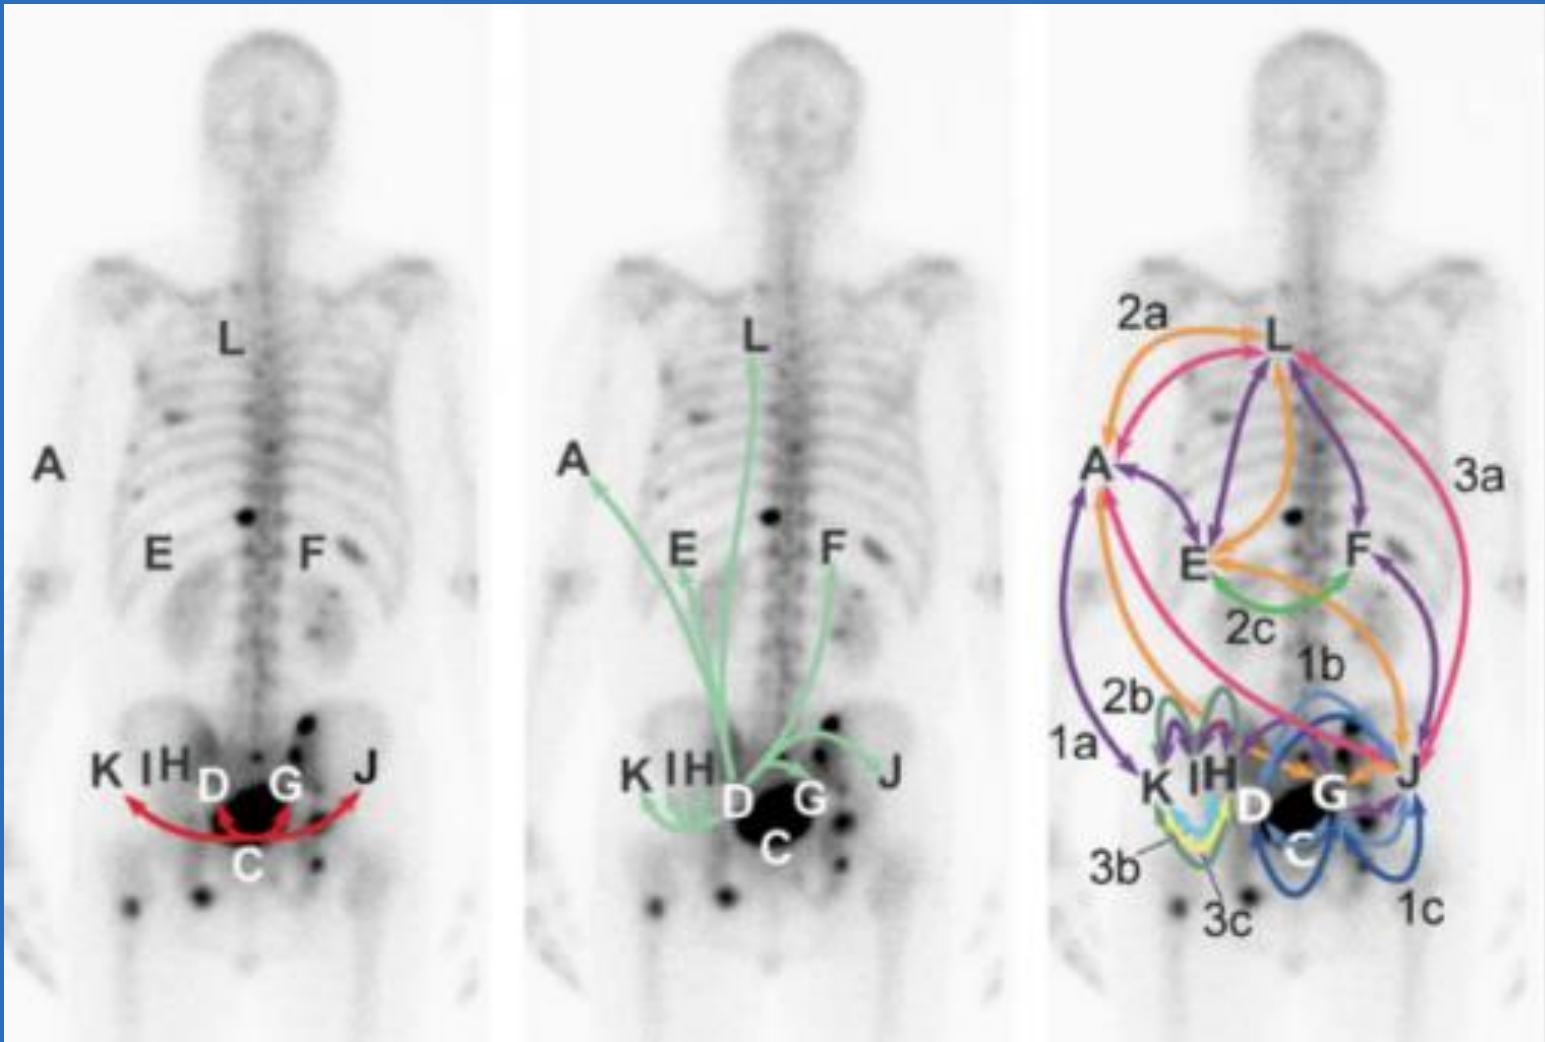

Genomically targeted trials are a reality!

Starting to target the HSPC space

Agent	Genomic Alteration	Treatment setting	N	Status

Surveillance or Metastasis Directed Therapy for Oligometastatic Prostate Cancer Recurrence: A Prospective, Randomized, Phase II Trial

Conclusions

Almost all metastatic prostate cancer patients should receive up-front intensification (Abi/Doce)

Future: use genomic classification to select for even more tx or de-intensification?

Novel therapies adding to ADT in mHSPC are targeting molecular sub-populations

Treatment of the primary and/or oligometas is best done as part of a clinical trial
