Kantoff, and Andrew J. Armstrong

CLINICAL STATES MODEL

Sequencing: Not so simple

Also -- there is no reason to think there is only one best sequence, or that the same sequence is best for everyone

Real life is not as predictable as the diagrams.

Therapeutic opportunities of the androgen axis

- ▶ Whole-body hormone changes
- ▶ Systemic *vs* intratumoral testosterone
- ▶ Intracellular testosterone and Androgen Receptor, and intranuclear Androgen receptor

Blocking androgen signaling: Hormonal vs molecular perspectives

Conventional hormonal axis:

GnRH: Hypothalamus –pituitary

FSH: pituitary FSH secretion

LH: pituitary LH secretion

T: Circulating testosterone

17-beta hydroxylase
ketoconazole
abiraterone

AR/dihydroxytestosterone binding

Leuprolide
Goserelin
Degarelix

Chinnaiyan, E. Hall, and J.S. de Bono

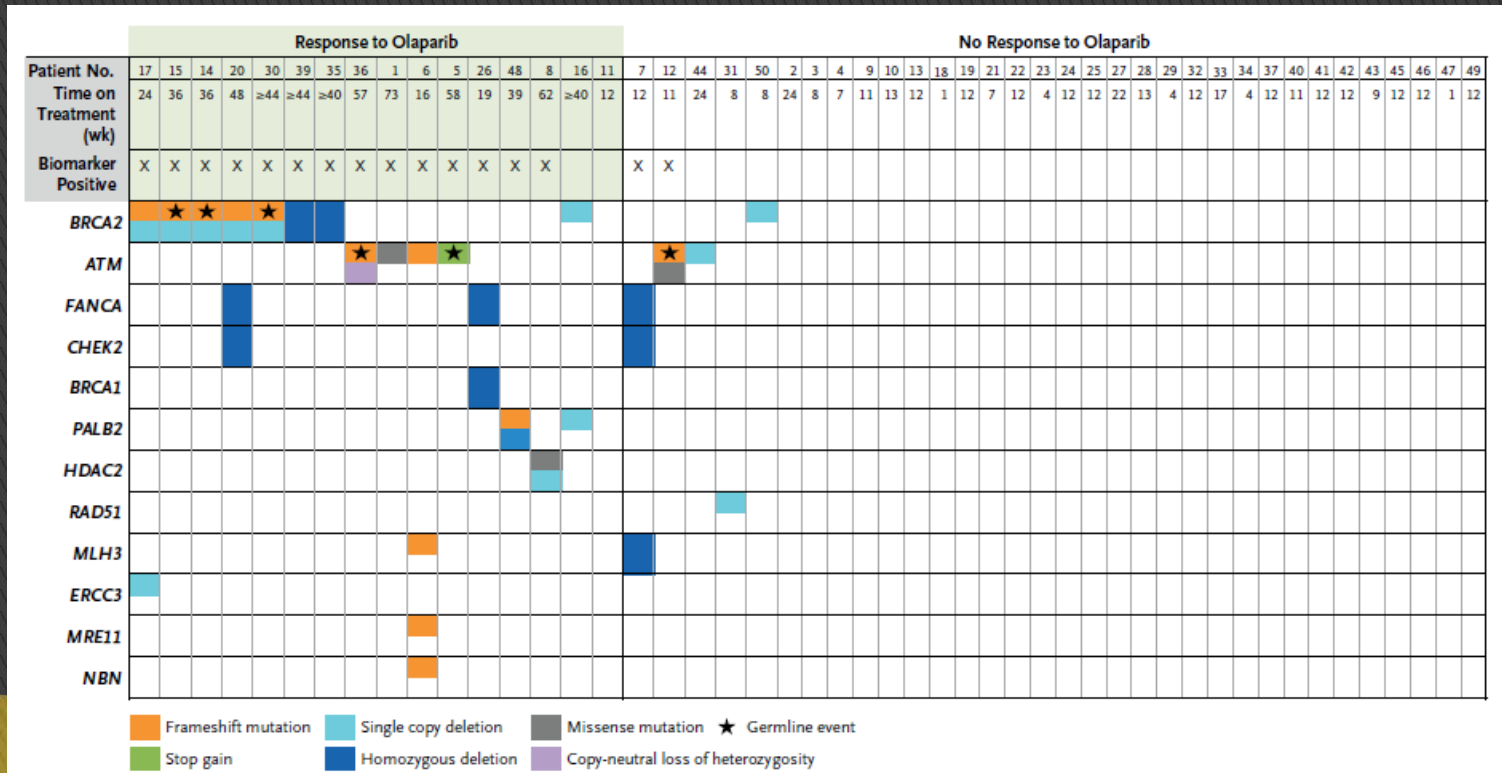

Figure 1. Genomic Aberrations in DNA Repair in Patients with Metastatic, Castration-Resistant Prostate Cancer.

Data are shown for the 49 patients who could be evaluated for a response. Mutations and deletions in DNA-repair genes were identified through next-generation sequencing studies. Green shading indicates patients who were classified as having a response to olaparib in the clinical trial. Patients were considered to be biomarker-positive if homozygous deletions, deleterious mutations, or both were detected in DNA-repair genes (but not single copy deletions without events detected in the second allele). A star indicates that a particular genomic event was detected in germline DNA. Archival tumor samples were used for the sequencing studies in Patients 13, 18, 21, 40, 41, and 49 because the biopsy samples obtained during the trial were negative for tumor content.

DNA-Repair Defects and Olaparib in Metastatic Prostate Cancer

J. Mateo, S. Carreira, S. Sandhu, S. Miranda, H. Mossop, R. Perez-Lopez, D. Nava Rodrigues, D. Robinson, A. Omlin, N. Tunariu, G. Boysen, N. Porta, P. Flohr, A. Gillman, I. Figueiredo, C. Chinnaiyan, E. Hall, and J.S. de Bono

Radiologic Progression-free Survival

Overall Survival

PARP directed prostate cancer trial examples:

- Olaparib vs enzalutamide vs abiraterone
- Olaparib before prostatectomy
- Olaparib, abiraterone or both
- Olaparib with pembrolizumab
- Niraparib plus antiandrogen
- Niraparib with radium
- Rucaparib with cediranib
- Nivolumab + one of: rucaparib, docetaxel, enzalutamide

Conclusions (1 / 3)

Sequencing strategies to ponder

All oral first; put off parenteral drugs

Taxanes first – save lower intensity treatment for older age

Hormone therapy / non hormone therapy / hormone therapy alternation

Hormone therapy salvage of hormone therapy only for slow progressors

Radium – as soon as bone-only pattern is seen

Provenge – as early as possible (metastasis, no pain, low PSA)

Provenge – in coordination with antiandrogen initiation

Adaptive schedules: Alternate treatment and hiatus, to delay

Best timing is not obvious

What benefit for slower rising PSA?

- ▶ Hormone therapies beyond conventional GnRH: Active, but little empiric sequencing or crossover experience.
- ▶ apalutamide
- ▶ enzalutamide
- ▶ abiraterone
- ▶ Adaptive vs continuous scheduling strategies
- ▶ Taxanes – early, late, in-between?
- ▶ Radium – be alert for optimal selection

Other treatments and evaluations:

- ▶ Immune therapies sipuleucel-T and beyond
- ▶ Flucyclovine (Axumin) imaging to identify oligometastatic cases for radiation therapy
- ▶ Early concurrent hormone therapy for prostate bed salvage radiation therapy
- ▶ SINE inhibitor KPT-8602 trials

**Thank you very much,
& questions.**
