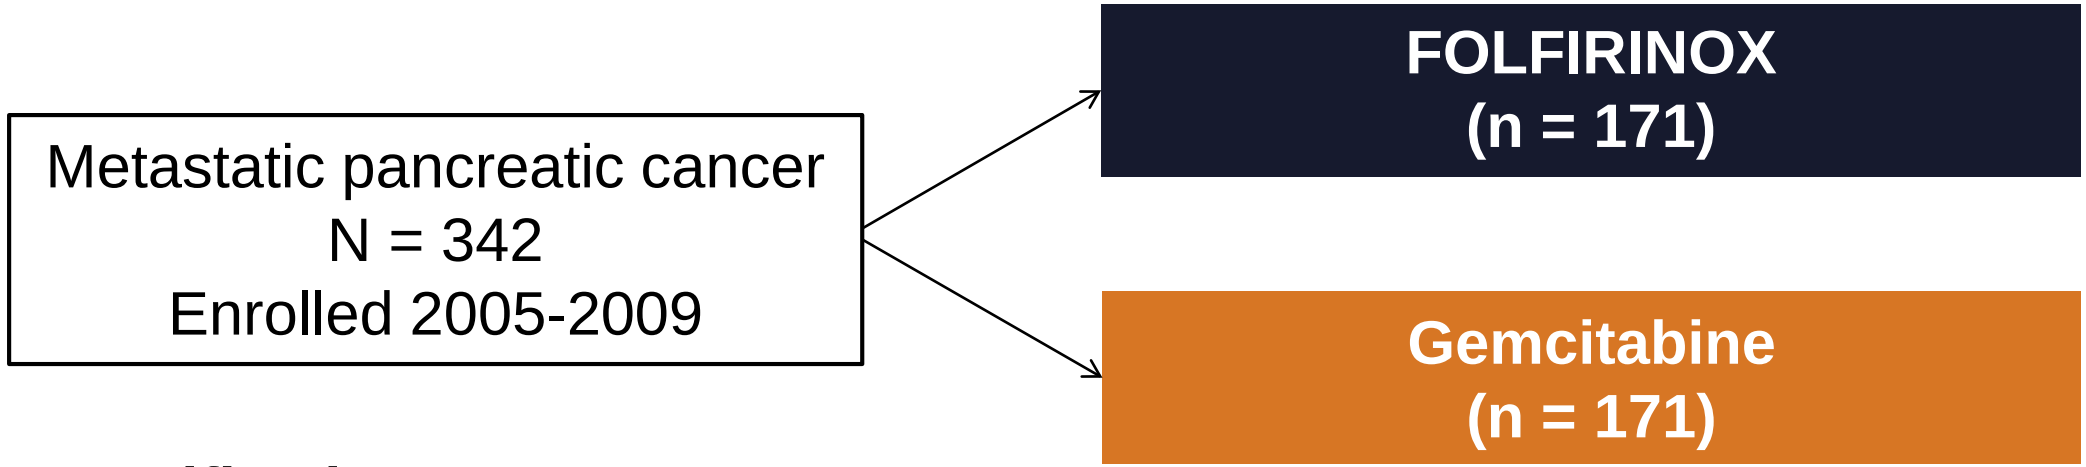
ACCORD: FOLFIRINOX Versus Gemcitabine[1]



Stratification

- PS: 0 or 1
- Tumor location
- Center

Endpoints

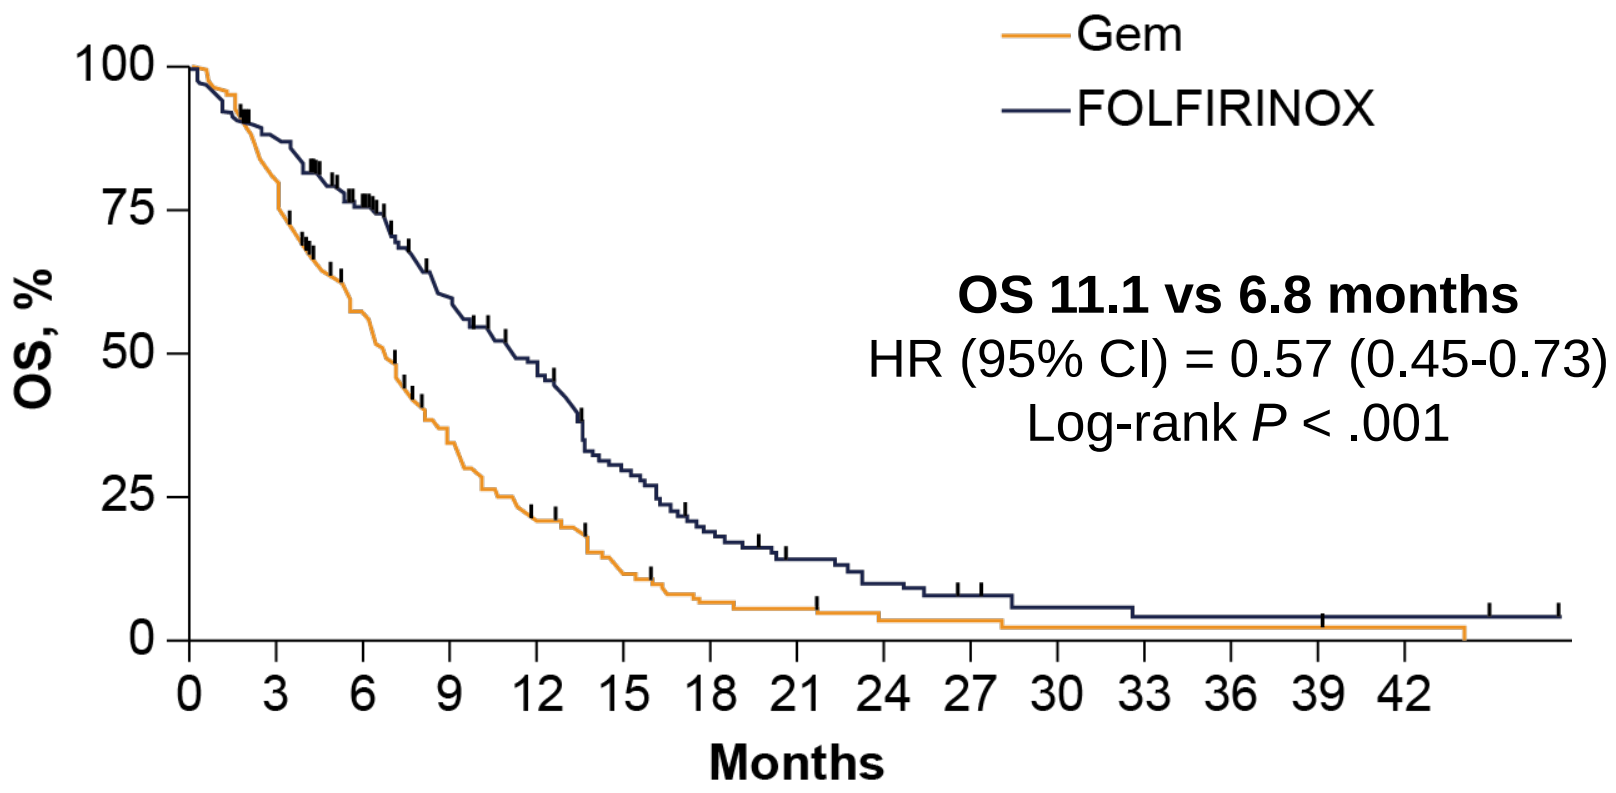
- Primary: OS
- Secondary: ORR, toxicity, PFS, and QOL

FOLFIRINOX

- Oxaliplatin 85 mg/m^2
- Leucovorin 400 mg/m^2
- Irinotecan 180 mg/m^2
- 5-FU 400 mg/m^2 bolus
- 5-FU 2,400 mg/m^2 over 46 h

1. Conroy T et al. *N Engl J Med*. 2011;364:1817-1825.

ACCORD Results: Overall Survival[1]



No. at Risk

Gem	171	134	89	48	28	14	7	6	3	3	2	2	2	2	1
FOLFIRINOX	171	146	116	81	62	34	20	13	9	5	3	2	2	2	2

1. Conroy T et al. *N Engl J Med*. 2011;364:1817-1825.

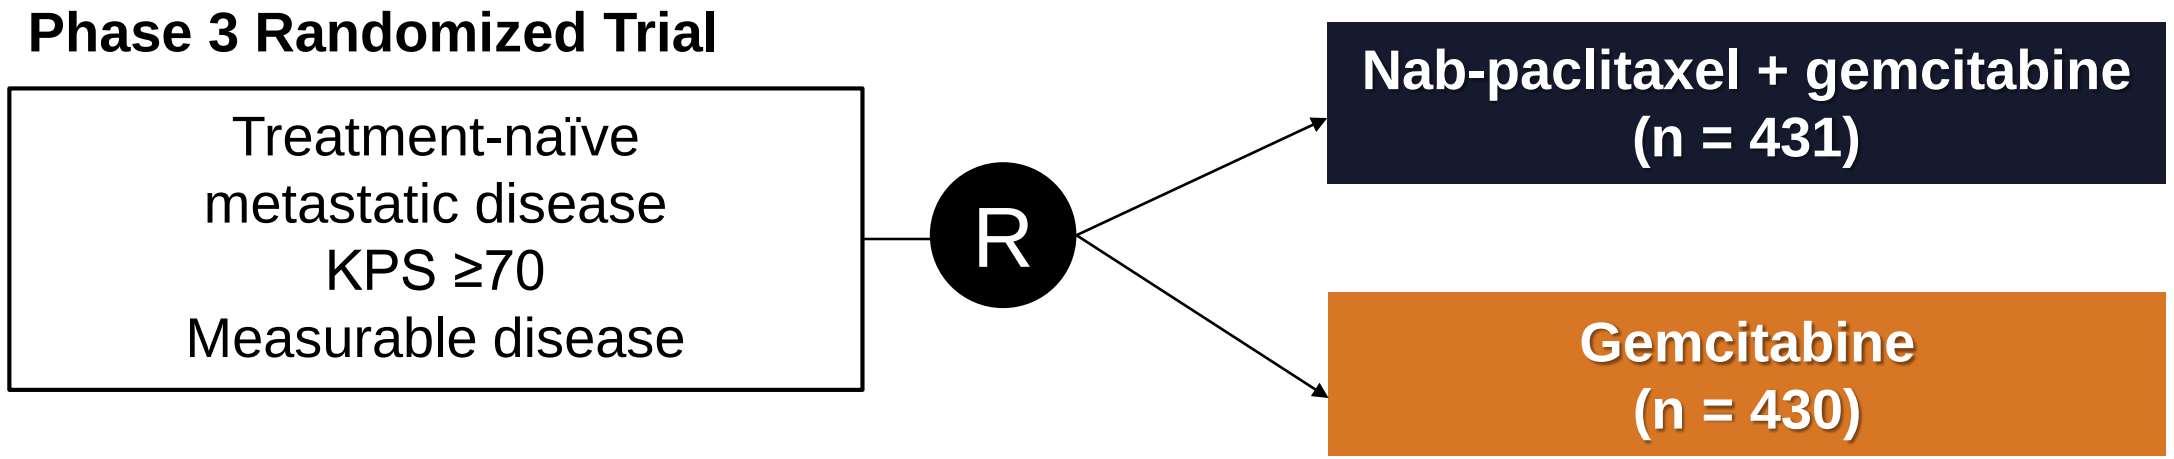
ACCORD: Common Grade 3 or 4 Adverse Events[1]

Event	FOLFIRINOX (n = 171)	Gemcitabine (n = 171)	*P*
	n/N (%)		
Hematologic			
Neutropenia	75/164 (45.7)	35/167 (21.0)	< .001
Febrile neutropenia	9/166 (5.4)	2/169 (1.2)	.03
Thrombocytopenia	15/165 (9.1)	6/168 (3.6)	.04
Anemia	13/166 (7.8)	10/168 (6.0)	NS

- **42.5% of patients who received FOLFIRINOX required growth factor support**

1. Conroy T et al. *N Engl J Med*. 2011;364:1817-1825.

MPACT: Gemcitabine +/- Nab-Paclitaxel[1]



Stratification

- KPS
- Region
- Liver metastasis

Endpoints

- Primary: OS
- Secondary
  - PFS
  - ORR by independent review
  - Safety and tolerability

Nab-paclitaxel: 125 mg/m^2 QW 3/4
Gemcitabine: 1,000 mg/m^2 QW 3/4

Gemcitabine: 1,000 mg/m^2 QW 7/8 then 3/4

1. Von Hoff DD et al. *N Engl J Med.* 2013;369:1691-1703.

MPACT: Overall Survival[1,2]

	OS, months		
	Events/n (%)	**Median (95% CI)**	**75th Percentile**
Nab-P + Gem	333/431 (77)	8.5 (7.89-9.53)	14.8
Gem	359/430 (83)	6.7 (6.01-7.23)	11.4

HR = 0.72 (0.617-0.835)
P = .000015

No. at Risk

nab-P + Gem	431	357	269	169	108	67	40	27	16	9	4	1	1	0
Gem	430	340	220	124	69	40	26	15	7	3	1	0	0	0

1. Von Hoff DD et al. *N Engl J Med.* 2013;369:1691-1703. 2. Goldstein D et al. *J Natl Cancer Inst.* 2015;107. pii: dju413.

MPACT: Adverse Events and Growth Factor Use

Event	Nab-Paclitaxel + Gemcitabine (n = 421)	Gemcitabine (n = 402)
Grade ≥3 nonhematologic AE occurring in >5% of patients, n (%)		
Fatigue	70 (17)	27 (7)
Peripheral neuropathy	70 (17)	3 (1)
Diarrhea	24 (6)	3 (1)
Grade ≥3 peripheral neuropathy		
Median time to onset, d	140	113
Median time to improvement by one grade, d	21	29
Median time to improvement to grade ≤1, d	29	NR
Use of nab-paclitaxel resumed, n/N (%)	31/70 (44)	NA

1. Von Hoff DD et al. *N Engl J Med.* 2013;369:1691-1703.

Comparison: FOLFIRINOX Versus Gemcitabine/Nab-Paclitaxel Phase 3 Trials[1,2]

	FOLFIRINOX	Gemcitabine/Nab-Paclitaxel
Sample size	342	861
Locations	France	North America, Europe, Australia
Eligibility criteria, PS	ECOG 0-1	KPS 70-100 (ECOG 2)
Survival, median (months)	11.1	8.5 (12.6)
1-year survival, %	48	35
Objective response, %	32	23[a] (29[b])
Toxicity (grade 3/4)	Fatigue, 24% Neutropenia, 46% Neuropathy, 9%	Fatigue, 17% Neutropenia, 38% Neuropathy, 17%
Poorer PS patients?	N/A	Benefit maintained in KPS 70-80 pts
QOL data?	Yes	Yes
More cost effective than gem?	Yes	Yes

[a] Independent review. [b] Investigator review.

1. Conroy T et al. *N Engl J Med*. 2011;364:1817-1825. 2. Von Hoff DD et al. *N Engl J Med.* 2013;369:1691-1703.

Guideline Recommendations: Metastatic Disease[1,2]

Good Performance Status[a]

- **Clinical trials**
- **Preferred**
  - FOLFIRINOX (PS 0-1)
  - Gemcitabine + nab-paclitaxel (KPS ≥70)
- Gemcitabine + erlotinib
- Gemcitabine

Poor Performance Status

- Gemcitabine[b]
- Capecitabine[c]
- Continuous 5-FU[c]

ASCO guidelines recommend gemcitabine alone for patients with PS = 2 or comorbidities; for PS ≥3 emphasis on supportive care measures

[a] All NCCN category 1 recommendations. [b] Category 2A recommendation. [c] Category 2B recommendation.

1. National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines in Oncology: Pancreatic Adenocarcinoma. v3.2017. https://www.nccn.org/professionals/physician_gls/pdf/pancreatic.pdf. Accessed January 11, 2018.
2. Sohal DPS et al. *J Clin Oncol*. 2016;34:2784-2796.

Guideline Recommendations: Second-Line Therapy[1,2]

Prior Gemcitabine

Category 1

- 5-FU/LV + nal-IRI
  - ASCO recommends PS 0-1

Category 2A

- FOLFIRINOX
- Oxaliplatin/5-FU/LV
- FOLFOX
- Capecitabine/oxaliplatin
- Capecitabine
- 5-FU continuous

Prior Fluoropyrimidine

Category 2A

- Gemcitabine + nab-paclitaxel
- Gemcitabine
- Gemcitabine cisplatin
- Gemcitabine erlotinib
- 5-FU/LV + nal-IRI (no prior irinotecan)

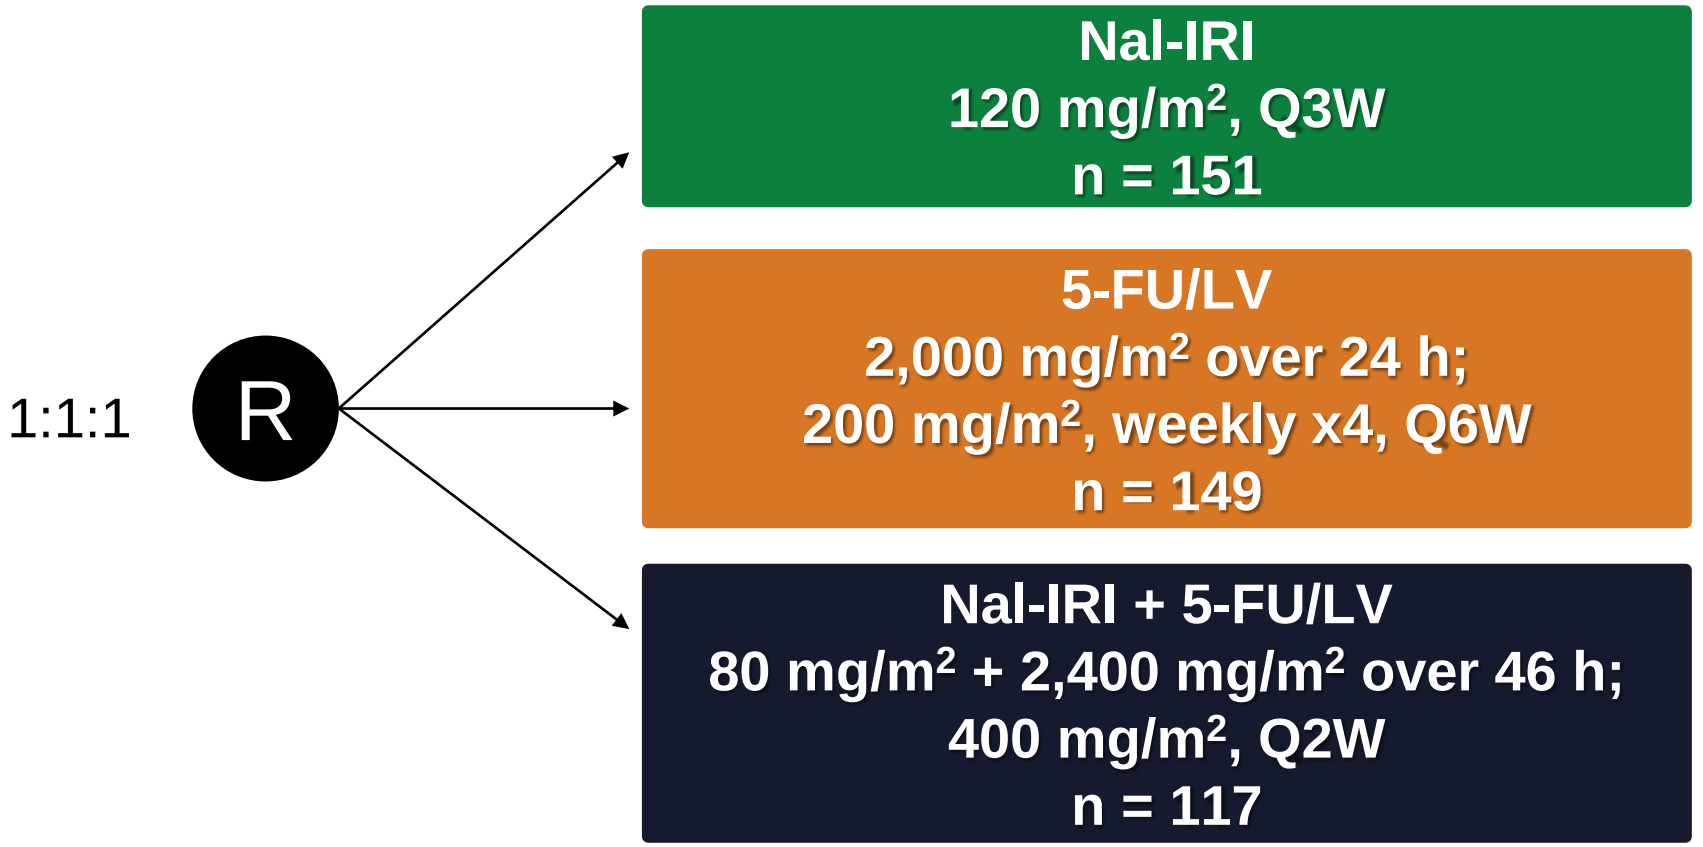
1. National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines in Oncology: Pancreatic Adenocarcinoma. v3.2017. https://www.nccn.org/professionals/physician_gls/pdf/pancreatic.pdf. Accessed January 11, 2018.
2. Sohal DPS et al. *J Clin Oncol*. 2016;34:2784-2796.

NAPOLI-1 Study of Nal-IRI[1]

Metastatic pancreatic cancer
Received prior gemcitabine-based therapy
N = 417

Stratification factors

- Albumin (<4.0 g/dL vs ≥4.0 g/dL)
- KPS (70 and 80 vs ≥90)
- Ethnicity (Caucasian vs East Asian vs others)

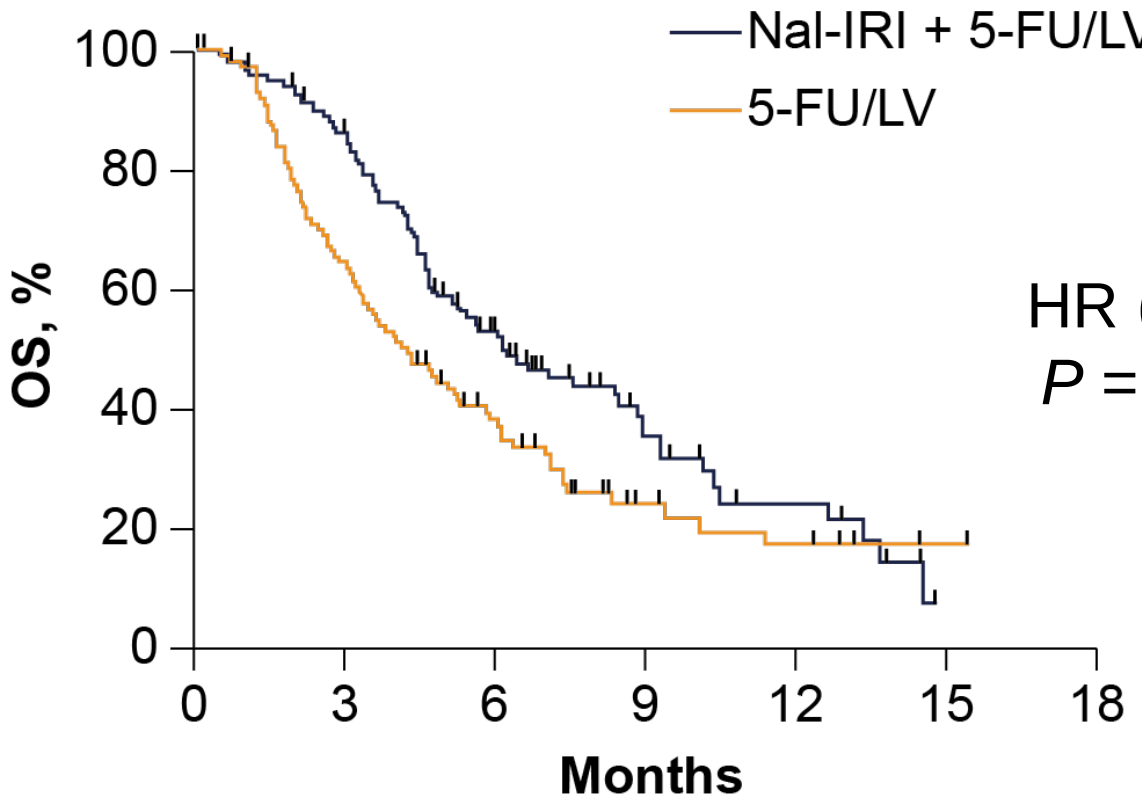


Primary endpoint: OS

Secondary endpoints: PFS, ORR, CA 19-9 response, and safety

1. Wang-Gillam A et al. *Lancet.* 2016;387:545-557.

NAPOLI-1: Overall Survival[1]



OS 6.1 vs 4.2 months

HR (95% CI) = 0.67 (0.49-0.92)

P = .012 (unstratified log-rank)

No. at Risk

Nal-IRI + 5-FU/LV	117	97	51	20	8	0	0
5-FU/LV	119	68	34	11	6	1	0

1. Wang-Gillam A et al. *Lancet.* 2016;387:545-557.

NAPOLI-1: Toxicities[1]

Event, n (%)	Nal-IRI + 5-FU/LV (n = 117)		5-FU/LV (n = 134)	
	Any Grade	Grades 3-4	Any Grade	Grades 3-4
Diarrhea	69 (59)	15 (13)	35 (26)	6 (4)
Vomiting	61 (52)	13 (11)	35 (26)	4 (3)
Nausea	60 (51)	9 (8)	46 (34)	4 (3)
Decreased appetite	52 (44)	5 (4)	43 (32)	3 (2)
Fatigue	47 (40)	16 (14)	37 (28)	5 (4)
Neutropenia[a]	46 (39)	32 (27)	7 (5)	2 (1)
Anemia	44 (38)	11 (9)	31 (23)	9 (7)
Hypokalemia	14 (12)	4 (3)	12 (9)	3 (2)

[a] Includes agranulocytosis, febrile neutropenia, granulocytopenia, neutropenia, neutropenic sepsis, decreased neutrophil count, and pancytopenia

1. Wang-Gillam A et al. *Lancet*. 2016;387:545-557.

Practice Point: Current Approaches in Treatment Sequencing for Advanced Pancreatic Cancer

PRESENTED AT: 2018 ASCO ANNUAL MEETING #ASCO18

PRESENTED BY: Thierry Conroy

Presented By Thierry Conroy at 2018 ASCO Annual Meeting

Background

- 6 months Gemcitabine (Gem) and/or fluoropyrimidine (S-1 in Japan) are standard adjuvant treatments for resected pancreatic cancer (PC) patients

Neuhaus P. *et al.* ASCO Annual Meeting 2008; #LBA4504
Uesaka K *et al.* Lancet 2016;388:248-57
Neoptolemos JP *et al.* Lancet 2017; 389:1011-24.

- However 71%-76% of patients still relapse within 2 years despite these treatments and there is an obvious need for a better drug or drugs' combination

Neoptolemos JP *et al.* JAMA. 2010;304:1073-81
Oettle H *et al.* JAMA. 2013;310:1473-81
Sinn M *et al.* J Clin Oncol. 2017;35:3330-7

- FOLFIRINOX is more effective than Gem as first-line treatment in metastatic PC for patients with good Performance Status

Conroy T *et al.* N Engl J Med 2011;364:1817-25

- The « modified » FOLFIRINOX regimen with no bolus fluorouracil is associated with less hematological toxicities and less diarrhea rate but maintained efficacy.

Mahaseth H *et al.* Pancreas. 2013;42:1311-5

Presented By Thierry Conroy at 2018 ASCO Annual Meeting

PRODIGE 24/CCTG PA.6 trial: study design

NCT01526135

- R0 or R1 resected pancreatic cancer
- postoperative CT-scan mandatory
- CA19-9 level < 180 U/mL within 12 weeks after surgery

Stratification:
- center
- resection margin (R0 vs R1)
- CA19-9 level (≤ 90 vs 91-179 U/mL)
- pN0 (< 12 vs ≥ 12 examined nodes) vs pN1

RANDOMIZE

1:1

mFolfirinox

Oxaliplatin 85 mg/m², Leucovorin 400 mg/m²,
Irinotecan 180 mg/m²*, all at D1
Fluorouracil continuous IV infusion 2.4 g/m² over 46 hours
Every 2 weeks; 12 cycles
**Reduced to 150 mg/m² after patient 162*

Gemcitabine

1000 mg/m², qw 3/4 *weeks;*
6 cycles

for both arms:
- 6 months of chemotherapy
- CT scans: every 3 months

Key Inclusion Criteria

- Histologically confirmed resected pancreatic ductal adenocarcinoma
- Macroscopically complete resection (R0 or R1 resection)
- Patients able to receive chemotherapy within 12 weeks after resection
- ECOG performance status 0 or 1
- Patients aged from 18 to 79 years
- No prior radiotherapy or chemotherapy
- Adequate hematologic/blood chemistry levels
- Patient information and written informed consent

Key Exclusion Criteria

- Metastatic disease, or macroscopic incomplete tumor removal (R2 resection)
- Postoperative CA 19-9 ≥ 180 U/ml assessed within 21 days of randomization
- Symptomatic heart failure or coronary heart disease
- Major comorbidity, active infection, history of HIV or uncontrolled diabetes
- Inflammatory bowel disease, or occlusion or sub-occlusion of the intestine or severe postoperative uncontrolled diarrhea
- Concomitant occurrence of another cancer, or significant history of cancer

Endpoints

- **Primary: Disease-Free Survival (DFS)**
- **Secondary:**
  - **Toxicity (NCI-CTC version 4.0 grading)**
  - **Overall survival (OS)**
  - **Cancer specific survival (SS)**
  - **Metastasis-free survival (MFS)**

Statistical considerations

Hypothesis:

- Study designed to have 80% power to detect an increase of 10% in 3 year-DFS (17% to 27%) corresponding to a hazard ratio (HR) = 0.74
- DFS defined as the first occurrence of any tumor recurrence or metastases, second cancer or death from any cause

Required sample size:

- 490 patients required to reach 342 events for final analysis, based on the use of the log-rank test with a two-sided significance level of 5%

Patients baseline characteristics

Characteristics		mFolfirinox N=247	Gemcitabine N=246	p
Median age (yrs) [range]		63 [30-79]	64 [30-81]	0.09

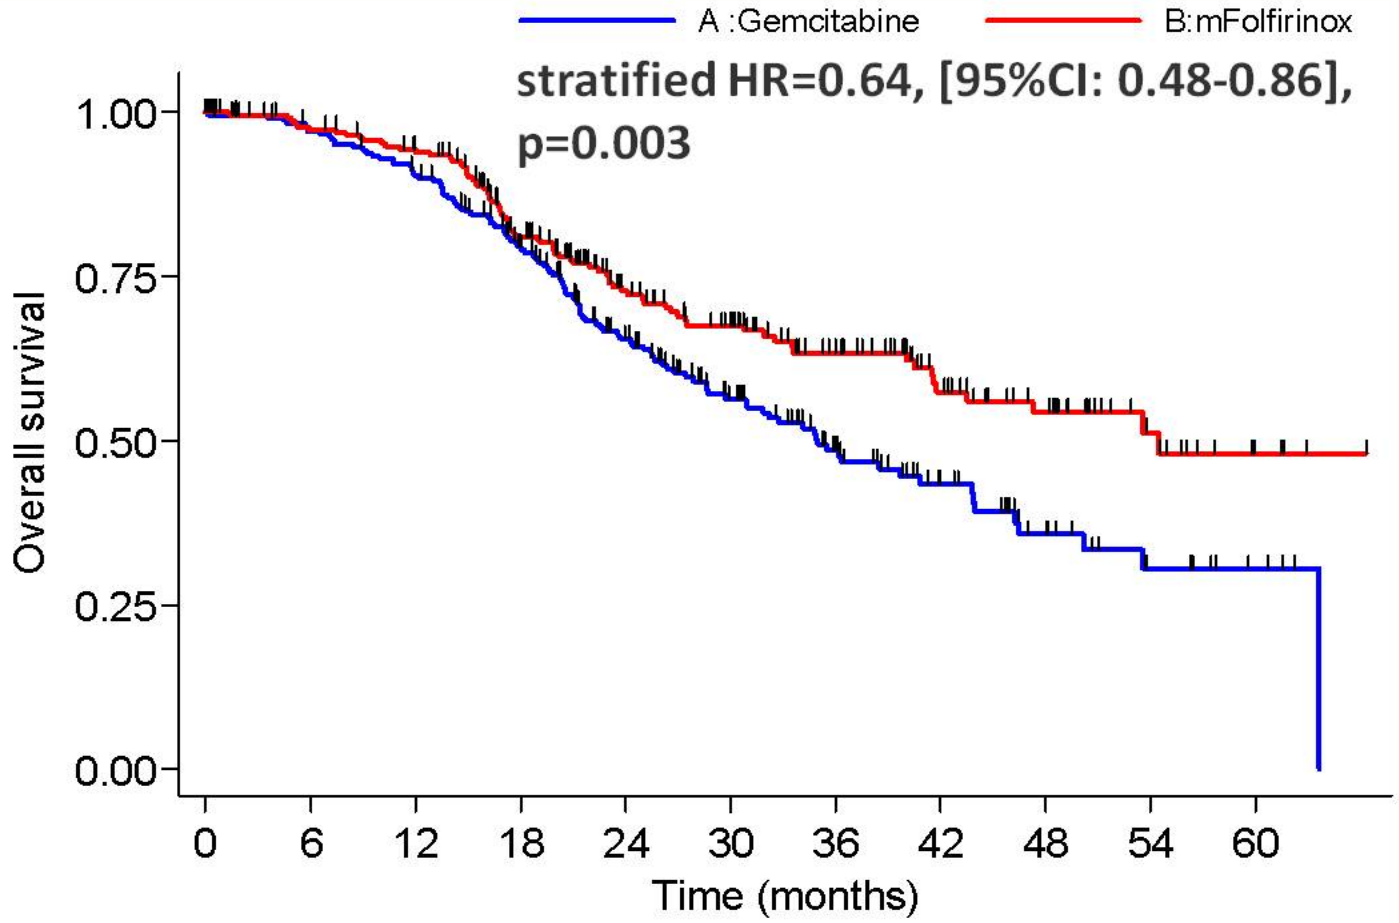
Overall Survival



Number at risk

A:Gemcitabine	246	233	215	171	120	81	55	33	18	9	4
B:mFolfirinox	247	223	210	165	119	91	68	46	32	16	4

Median overall survival:

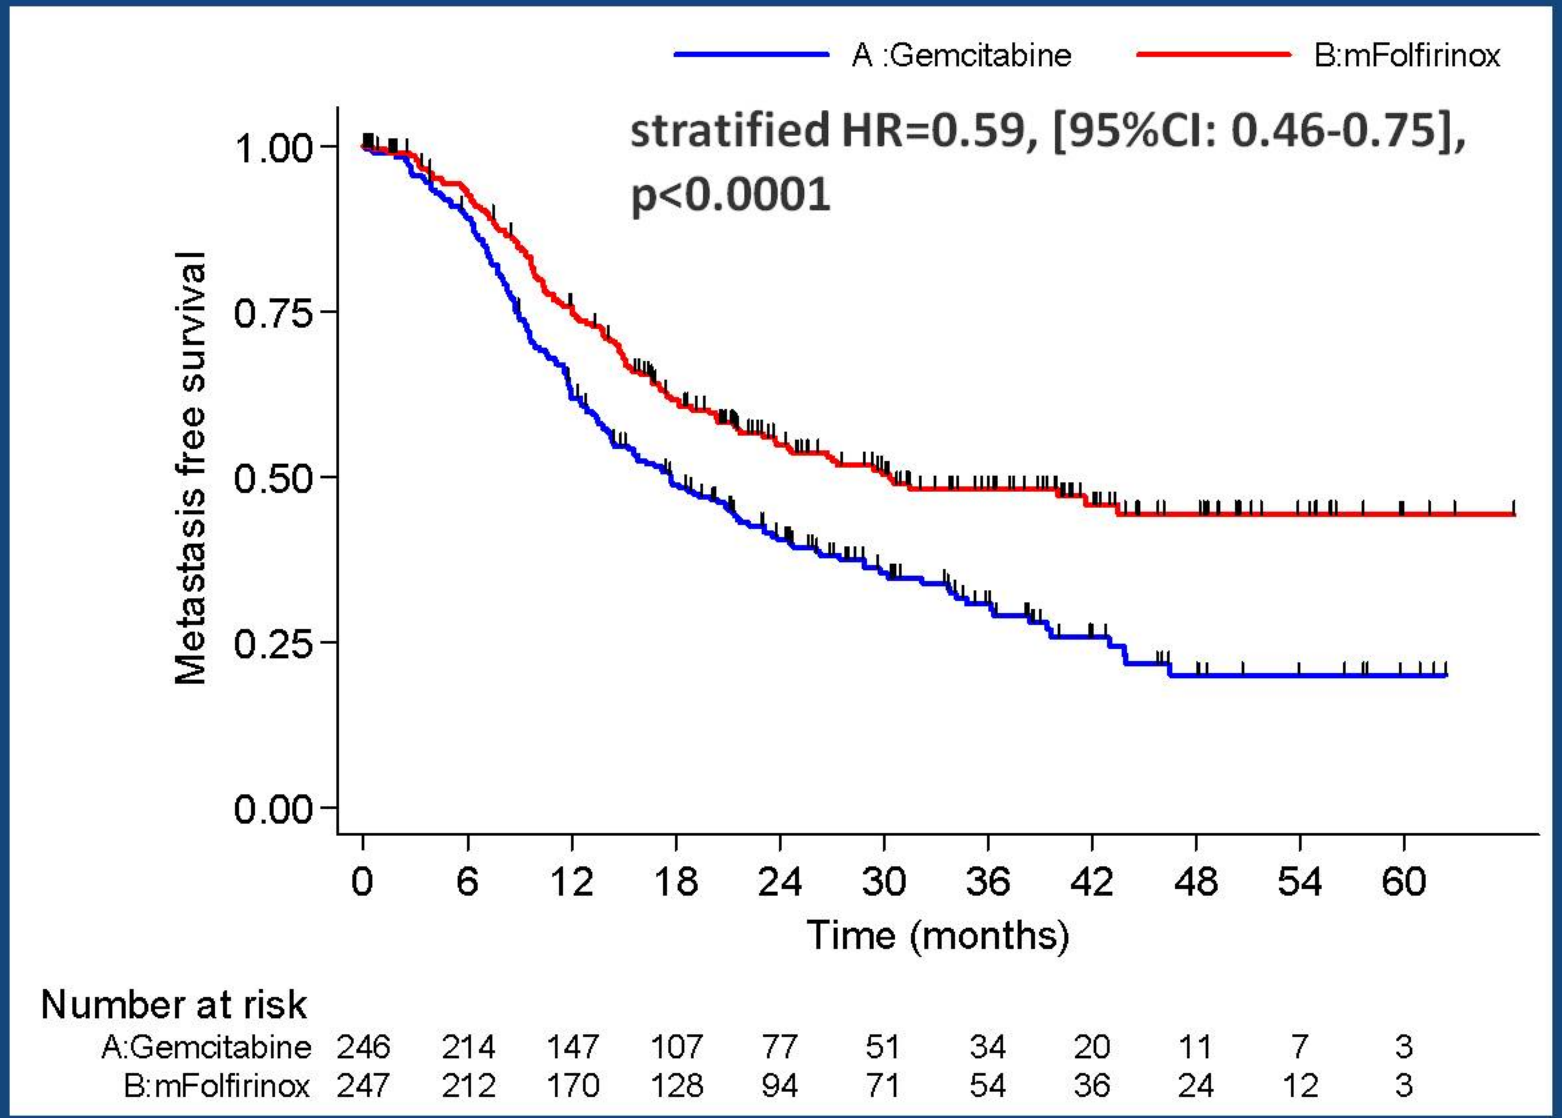
- **54.4 months** [95%CI: 41.8-NR] **with mFolfirinox**
- **35.0 months** [95%CI: 28.7-43.9] **with Gemcitabine**

3-year overall survival:

No OS events=192

- **63.4% (mFolfirinox) vs 48.6 % (Gem)**

Metastasis-free Survival



No MFS events: 273

Median:

- **30.4 months**
  [95%CI: 21.7-NR]
  with mFolfirinox
- **17.7 months**
  [95%CI: 14.2-21.5]
  with Gemcitabine

Presented By Thierry Conroy at 2018 ASCO Annual Meeting

Conclusions

- **Adjuvant chemotherapy with mFOLFIRINOX in resected PC patients is superior to Gem, with significantly improved Disease-Free Survival, Metastasis-free Survival, Specific Survival and Overall Survival**
- **Its superiority is observed in all predefined subgroups**
- **mFOLFIRINOX is more toxic than Gem, but is a safe regimen with manageable toxicities**
- **mFOLFIRINOX should now be considered a new standard of care after pancreatic cancer resection in patients with good performance status, at least in Western countries**

PRODIGE 24- Remaining Questions

What treatments were given with recurrence, which chemo regimens, balanced?

Was radiation given with local recurrence?

Based on treatment intensity, can adjuvant FNOX be given for 3 vs. 6 months?

Will APACT trial be positive and if not, will this impact metastatic treatment choices?

How will this impact neoadjuvant approaches?

FOLFIRINOX until progression, FOLFIRINOX with maintenance treatment, or sequential treatment with gemcitabine and FOLFIRI.3 for first-line treatment of metastatic pancreatic cancer: A randomized phase II trial (PRODIGE 35-PANOPTIMOX)

DAHAN Laetitia, PHELIP Jean-Marc, Le MALICOT Karine, WILLIET Nicolas, DESRAME Jérôme, VOLET Julien , PETORIN Caroline, MALKA David, REBISCHUNG Christine, APARICIO Thomas, LECAILLE Cédric, RINALDI Yves, TURPIN Anthony, BIGNON Anne-Laure, BACHET Jean-Baptiste, SEITZ Jean-François, LEPAGE Come, FRANCOIS Eric

Design of PRODIGE 35 PANOPTIMOX study

OBJECTIVES

- **Primary endpoint**: 6 months progression free survival rate (clinic or radiologic)

- **Secondary endpoints**:
  - overall survival
  - progression free survival
  - best response rate
  - safety (neurotoxicity)
  - second line therapy

PRIMARY ENDPOINT (mITT): 6 months Progression Free Survival rate

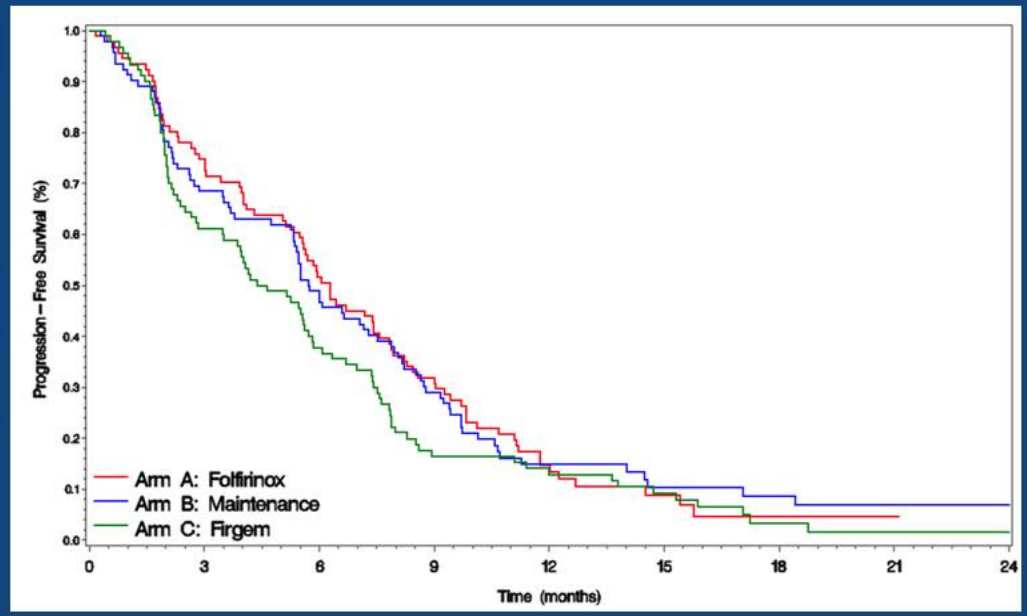
	Arm A (N = 87)	Arm B (N = 91)	Arm C (N = 88)
6 months PFS rate : N (%) [95% one-sided CI]	41 (47.1)	40 (44.0) [35.1 ; 53.1]	30 (34.1) [25.7 ; 43.3]

- Arm A results were consistent with PRODIGE 4 survival rate
- Firgem (arm C) was considered as ineffective
- **Folfirinox with maintenance by 5FU (arm B) was considered as effective**

PROGRESSION FREE SURVIVAL (PFS)

ITT Set	Arm A (N = 91)	Arm B (N = 92)	Arm C (N = 90)
Overall PFS* (mo) - Median - 95%CI	 6.3 5.3-7.6	 5.7 5.3-7.5	 4.5 3.5-5.7
9 months PFS (%)	31.9	29.1	16.4
12 months PFS(%)	14.7	14.9	12.9

*PFS was defined by first progression as any chemotherapy received

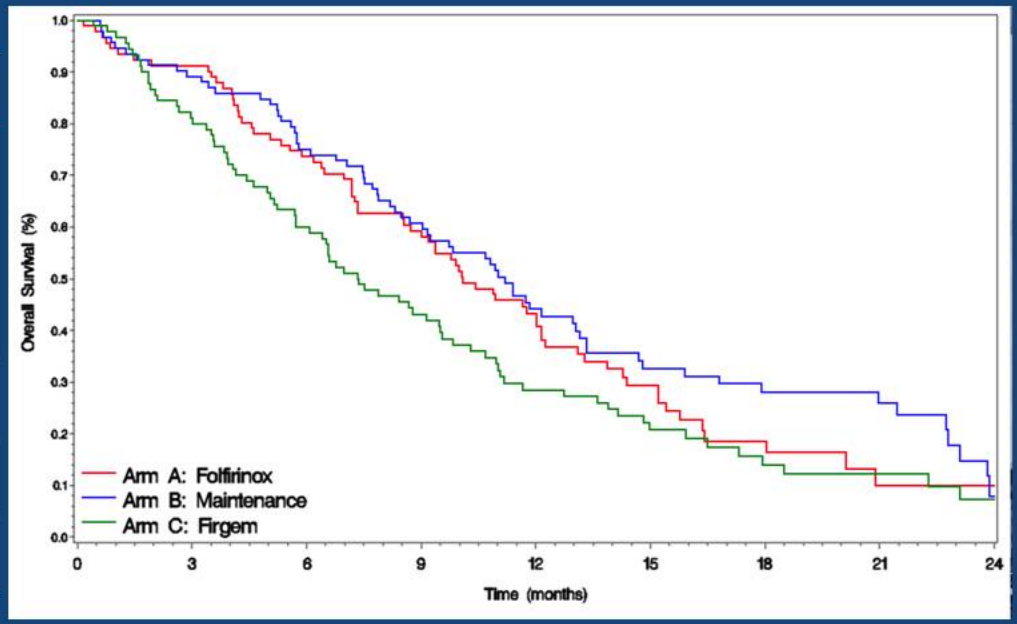


In arm B (maintenance therapy):

- PFS2 (progression during Folfirinox regimen): 7.1 months [5.32-8.05]
- Reintroduction of Folfirinox 29.7% (27 patients among 52 disease control at 6 months)

OVERALL SURVIVAL (OS)

ITT Set	Arm A (N = 91)	Arm B (N = 92)	Arm C (N = 90)
Overall survival (months) - Median - 95% CI	 10.1 8.5-12.2	 11.0 8.7-13.1	 7.3 5.7-9.5
6 months OS (%)	73.6	75.0	60.0
12 months OS (%)	43.3	44.1	28.5
18 months OS (%)	18.5	28*	13.9



*Exploratory analysis for overall survival: $p < 0.05$

BEST RESPONSE RATE

	Arm A (N = 83)	Arm B (N = 81)	Arm C (N = 74)
Objective response N (%)	31 (37.3)	31 (38.3)	20 (27.0)
Stable disease N (%)	35 (42.2)	31 (38.3)	37 (50.0)
Progression N (%)	17 (20.5)	19 (23.5)	17 (23.0)

TREATMENT

Intent-to-treat	Arm A (N = 88)	Arm B (N = 91)	Arm C (N = 87)
Mean number of cycles*	8.63	13.64	9.83
Mean duration of treatment (mo)	4.19	6.95	5.95
Mean duration of maintenance treatment (mo) in arm B	-	4.49	-
Number of folfirinox cycles in arm A and B (mean [SD])	8.66 [3.87]	7.7 [4.3]	-
Number of folfirinox cycles in arm A and B within first 6 months (mean [SD])	5.59 [3.34]	4.22 [2.38]	-
Number of folfirinox cycles in arm A and B after 6 months (mean [SD])	1.25 [0.45]	3.68 [2.58]	-

*all sequences

TOLERANCE:
Most common grade 3-4 adverse events

Two patients died from treatment-related cause: one from sepsis in the folfirinox arm, one from hypertonicity-induced coma in the firgem group

SP Set	Arm A (N = 88)	Arm B (N = 91)	Arm C (N = 87)
Hematologic	1 (1.1)	5 (5.5)	1 (1.1)
- Neutropenia	25 (28.4)	23 (25.3)	28 (32.2)
- Febrile neutropenia	1 (1.1)	5 (5.5)	-
- Thrombopenia	4 (4.5)	5 (5.5)	7 (8.0)
- Anemia	6 (6.8)	7 (7.7)	6 (6.9)
Non hematologic			
- Asthenia	22 (25.0)	28 (30.8)	28 (32.2)
- Vomiting	11 (12.5)	13 (14.3)	13 (14.9)
- Diarrhea	10 (11.4)	16 (17.6)	16 (18.4)
- **Sensory neuropathy**	9 (10.2)	17 (18.7)	0 (0)

TOLERANCE: Neurotoxicity grade 3-4

	Arm A (N = 88)	Arm B (N = 91)
Neurotoxicity Gr 3-4 (ITT)- N (%)	9 (10.2)	17 (18.7)
Neurotoxicity Gr 3-4 within First 6 months- N (%)	9 (10.2)	10 (11.0)
Max Grade neurotoxicity reached (whatever max grade is)		
- First 6 months N (%) - After 6 months N (%)	64 (94.1) 4 (5.9)	49 (70.0) 21 (30.0)
Median ratio of oxaliplatine (%)* [Range]	83 [46.9;102.5]	92 [92.1; 104.6]

*Ratio between received dose and targeted dose

CONCLUSIONS

- FOLFIRINOX with maintenance by LV5FU2 in patients with metastatic pancreatic cancer controlled after four months of induction chemotherapy appears to be feasible and effective. Firgem regimen seems to be ineffective in our study

- Unexpectedly maximal severe neurotoxicity rate was higher in the maintenance therapy arm, mostly due to a higher cumulative oxaliplatin dose delivered. Moreover, grade 3 or 4 neurotoxicity occurred later in maintenance arm.

- Other analyses are in progress, we are waiting for results about quality of life, duration of disease control, and sub groups analyses

- A phase III trial comparing folfirinox versus folfirinox maintenance with 5FU is needed to confirm these results

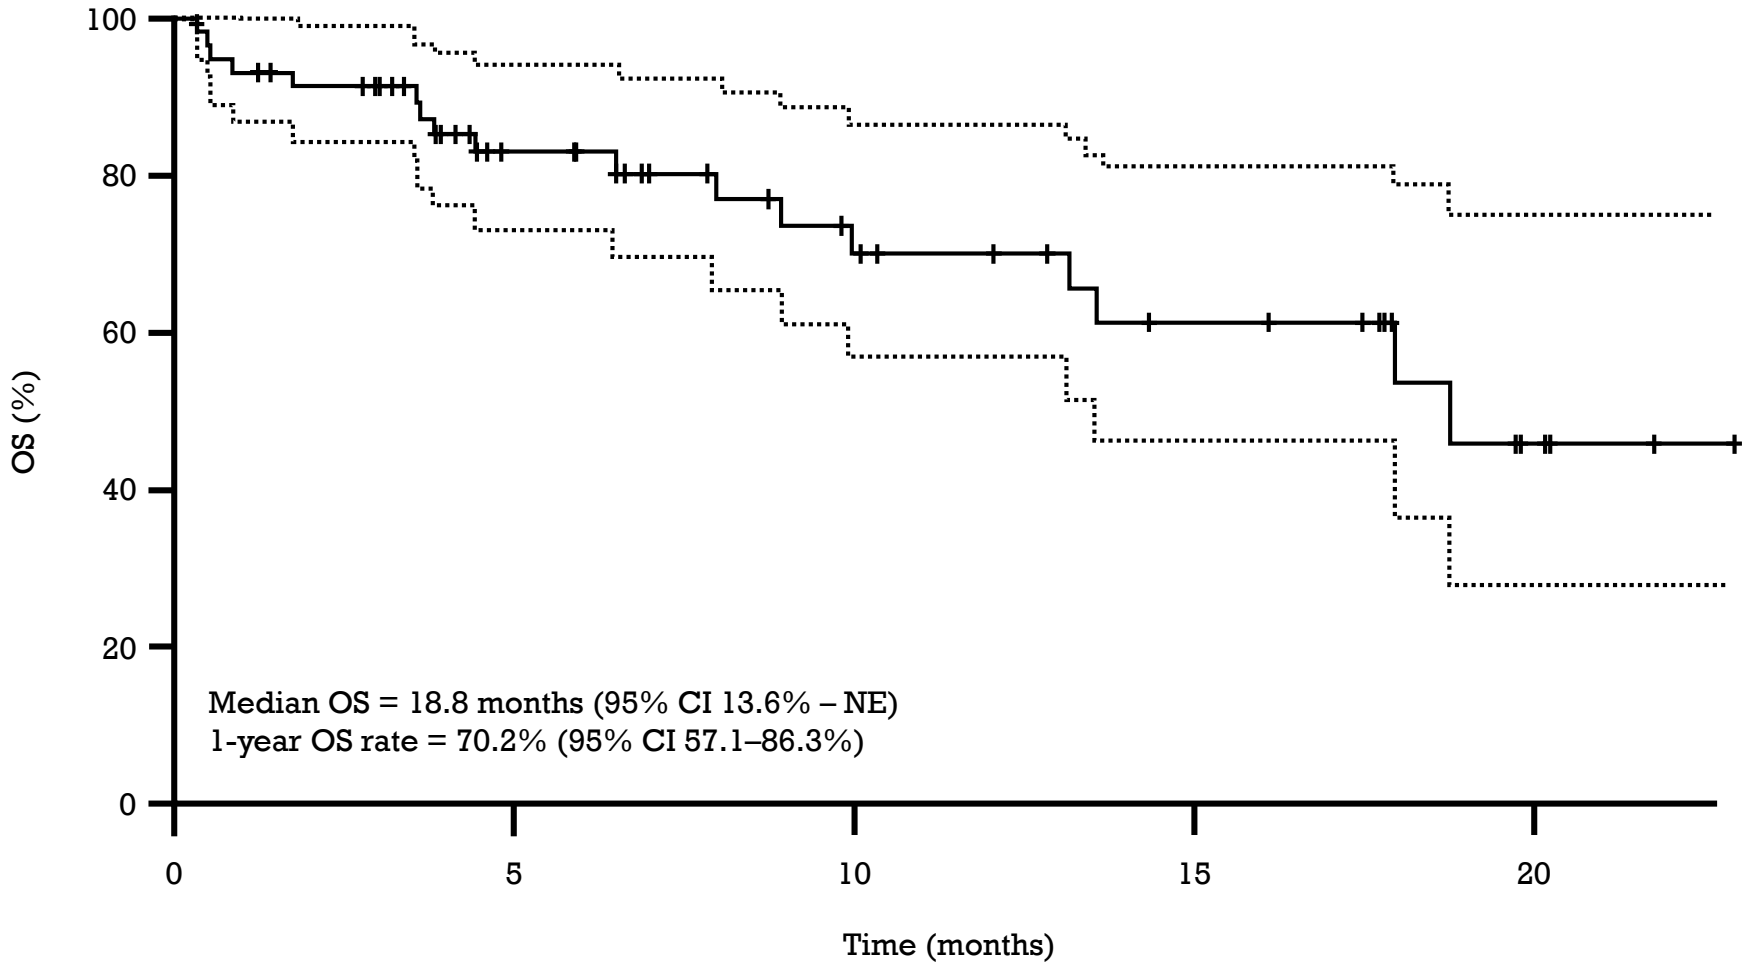
PD, n (%)	8 (13.6)	8 (16.0)

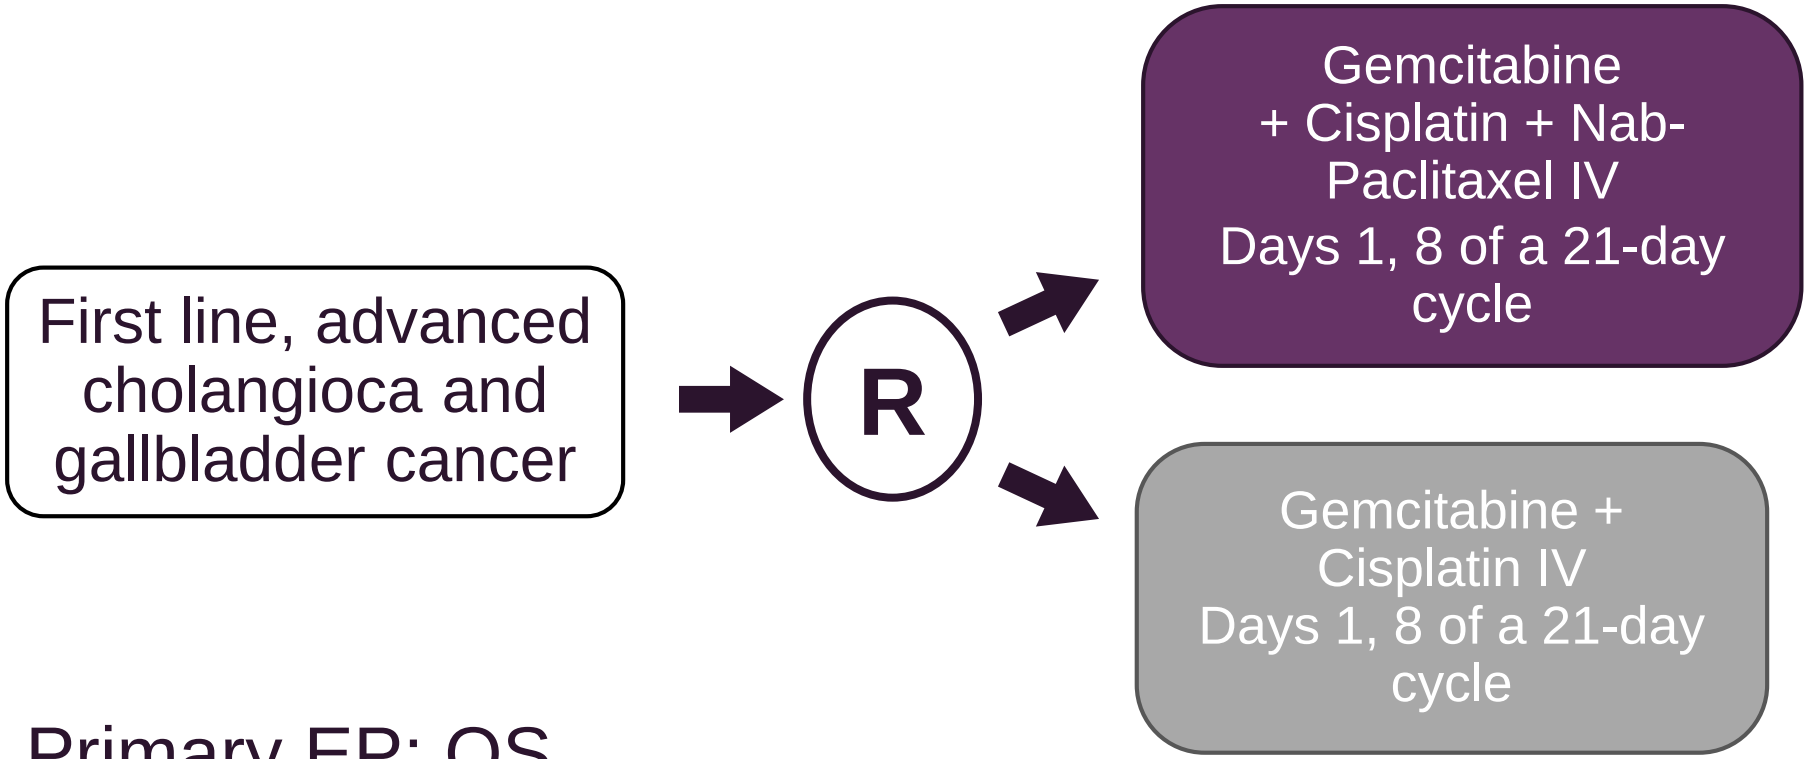
- 3 patients in the high-dose group and 4 in the reduced-dose group underwent surgery following conversion to resectable disease
- 1 patient in the high-dose group achieved a pathologic complete response

GAP OS: all treated patients



NE, not evaluable

GAP Phase III: Proposed Study Design



Primary EP: OS

Secondary: ORR,PFS

Molecular Profiling

- Novel biomarkers and targets can be used to improve the outcomes.
- Stratification into subgroups can also provide prognostic implications.
- These targets can be explored for their therapeutic value using novel inhibitors.

Molecular Heterogeneity in BTC

CGP Findings	IHCCA	EHCCA	GBCA

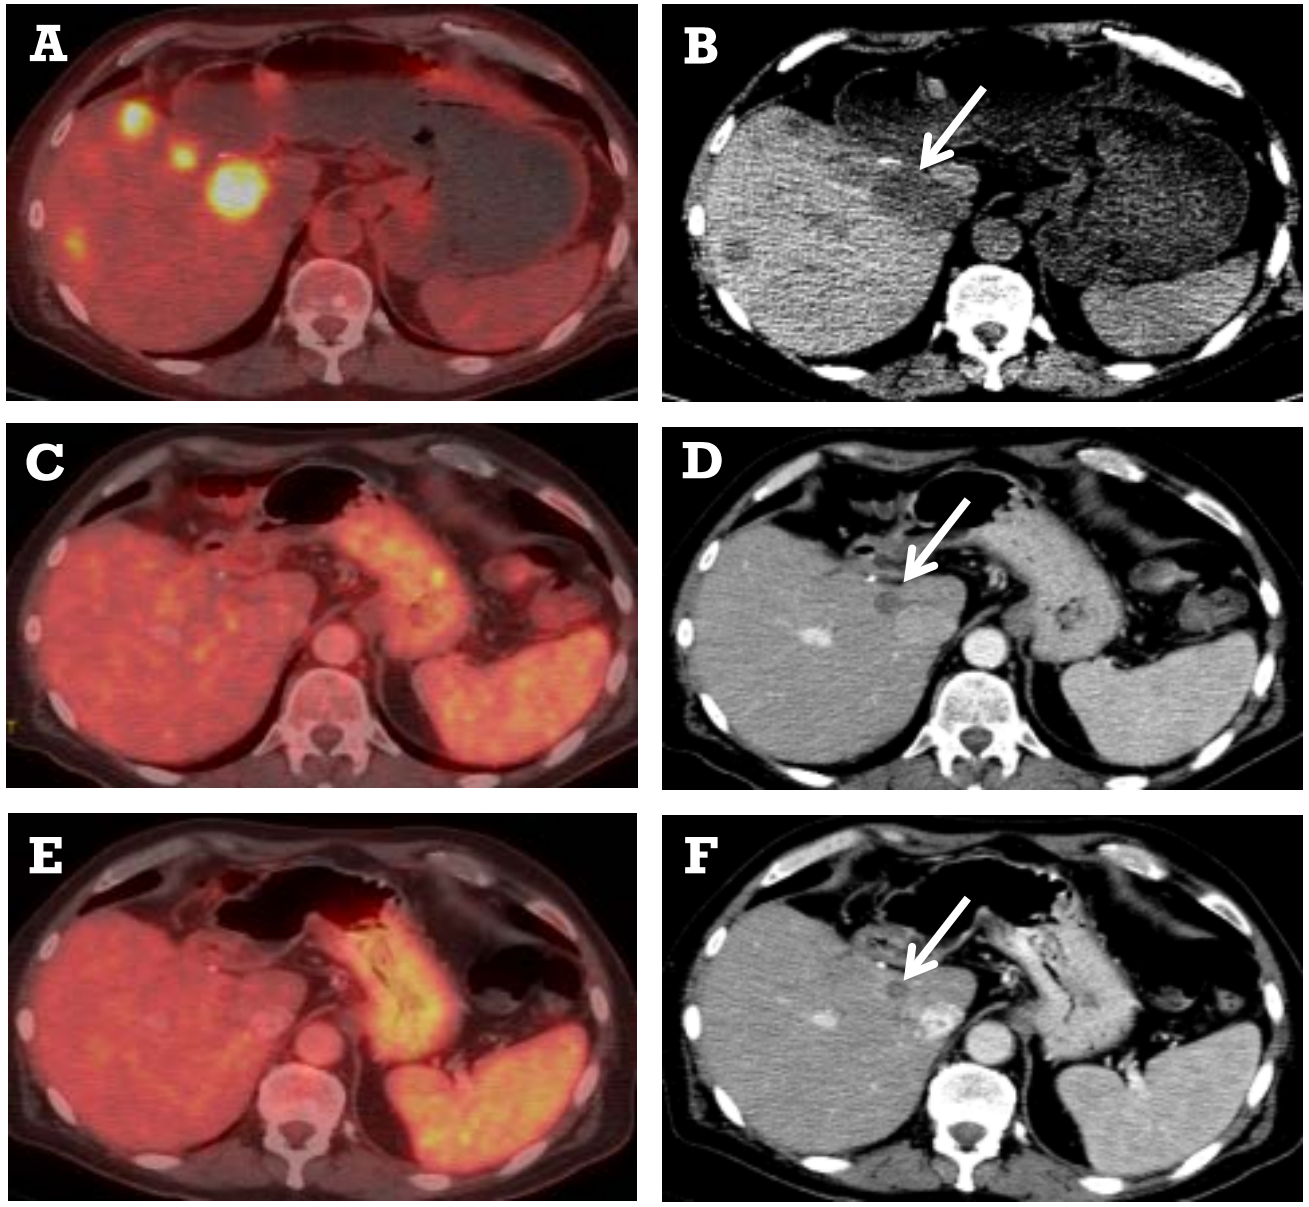
Cancer. 2016;122(24):3838-3847



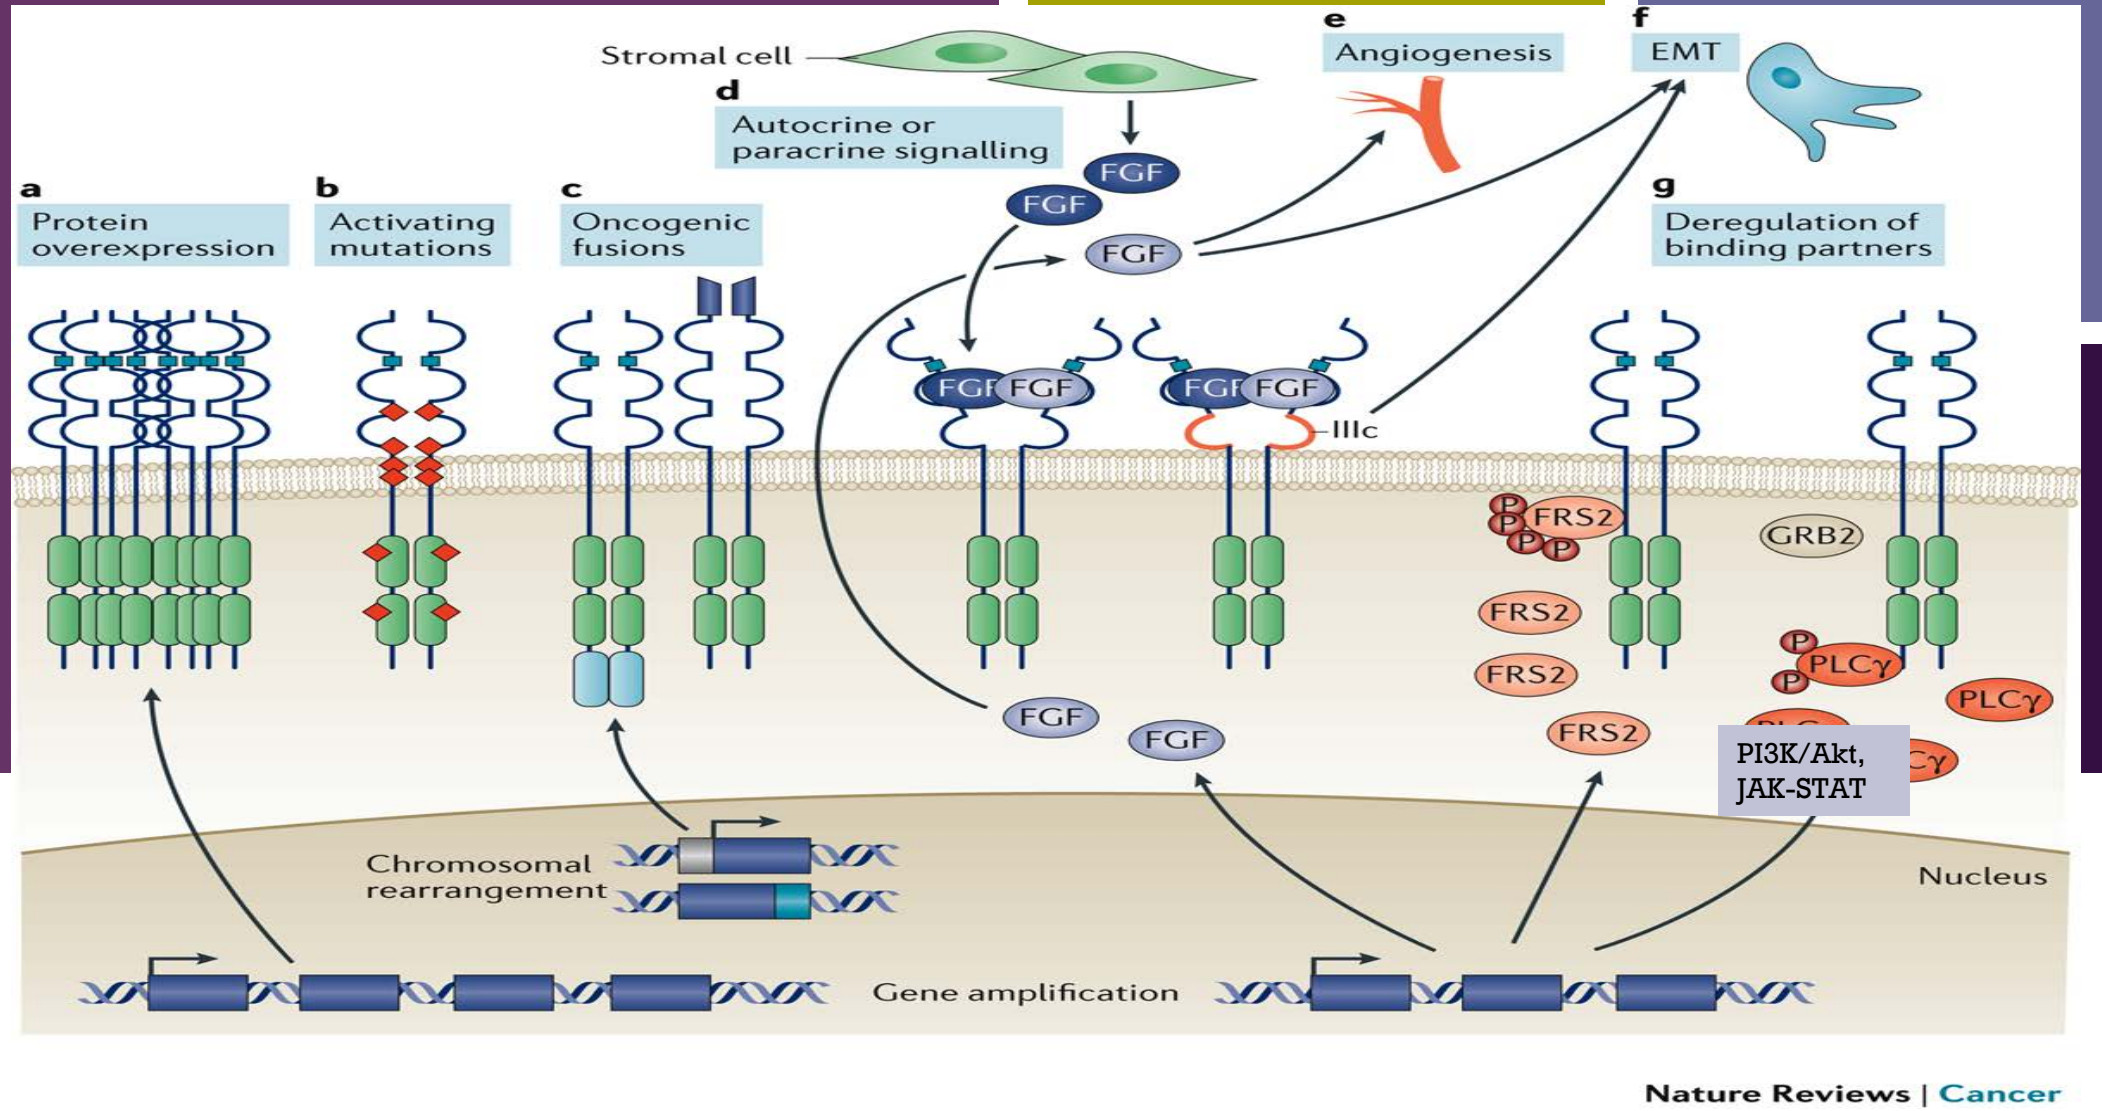
IHCCA with *BRAF* V600E Mutation Responds to RAF Kinase Inhibition

A 67 year old male with metastatic intrahepatic cholangiocarcinoma, who had progressed on conventional chemotherapy. B-Raf mutation detected. Axial (A) fused PET-CT and (B) unenhanced CT images from a PET scan demonstrate FDG avidity of multiple liver metastases. After 8 weeks of b-raf inhibitor therapy, axial (C) fused PET-CT and (D) contrast-enhanced CT images demonstrate lack of FDG avidity and decreased size of liver metastases, e.g., the dominant lesion adjacent to the IVC (arrow) decreased from 3.7 cm to 1.6 cm. After 16 weeks of therapy, axial (E) fused PET-CT and (F) contrast-enhanced CT images demonstrate continued lack of FDG avidity and further decreased size of liver metastases, e.g., the dominant lesion (arrow) now measures 1.3 cm.

EGFR amplification in GBCA with Response to Neoadjuvant Erlotinib in Combination with Systemic Therapy

A 67 year old woman with GBCA who developed liver metastases. Genomic profiling of the liver metastasis specimen in this patient revealed focal amplification of *EGFR* (16 copies), amplification of *CCND1* (13 copies) and mutations in *PIK3CA* and *TP53*. On the left is CT of pre- gemcitabine + erlotinib neo-adjuvant treatment and the CT image on the right is post-completion of neoadjuvant treatment.

MECHANISMS OF ONCOGENIC FGFR SIGNALING



Babina, Nature Reviews Cancer, May 2017

	Agent	Activity	Disease
Non-Selective	Dovitinib	FLT3, c-KIT, FGFR1,3, VEGFR1,3	Gastric, urothelial, renal
	Ponatinib	ABL, PDGFRa, VEGFR2, FGFR1, c-SRC	Biliary, Advanced solid tumors
	Lucitanib ARQ087	VEGFR1-2, FGFR 1-2 (83nM) FGFR 1-3 (1.8-4.5 nM), KIT, RET, PDGFRB	Breast, Lung CCA
	AZD4547	FGFR1, 2,3 (1-2.5nM)	NSCLC
Selective	BGJ398	FGFR1,2,3 (1nM) FGFR4 (60nM)	SCC, Bladder, Biliary
	JNJ-42756493	FGFR1-4 (<1nM)	Liver, bladder, NSCLC, Gastric
	INCB054828 DEBIO 1347	FGFR 1-3, VEGFR2 FGFR 1-3	
	TAS-120 LY2874455	FGFR1-4 VEGFR2, FGFR 1-4	Solid tumors, CCA
AB Ligand Trap	FP-1039 FPA114	FGF2 FGFR2-IIb	Solid tumors

Phase 2 study of BGJ398 in patients with FGFR-altered advanced cholangiocarcinoma

- Multicenter, open-label, phase 2 study adults with advanced CCA with *FGFR2* fusions or *FGFR* alterations who had progressed on prior therapy
- The primary endpoint-overall response rate
- BGJ398 125 mg once daily for 21 days, then 7 days off (28-day cycles).
- Sixty-one patients (35 women; median age 57 years) with *FGFR2* fusion (n=48), mutation (n=8), or amplification (n=3)

Javle et al. Clin Oncol 2017

Phase 2 study of BGJ398 in patients with FGFR-altered advanced cholangiocarcinoma

- ORR=14·8% (18.8% *FGFR2* fusions only),
- DCR was 75·4% (83.3% *FGFR2* fusions only) > 6 months, despite prior therapies, median PFS was 5·8 months
- Adverse events included hyperphosphatemia (72·1% all grade), fatigue (36·1%), stomatitis (29·5%), and alopecia (26·2%).
- Grade 3/4 (41%) and included hyperphosphatemia (16·4%), stomatitis (6·6%), and palmar-plantar erythrodysaesthesia (4·9%).
- Rare class effects: keratopathy, eye dryness, asymptomatic retinal detachment

TAIHO ONCOLOGY PRESENTS DATA ON KEY INVESTIGATIONAL COMPOUND TAS-120 AT ESMO 20TH WORLD CONGRESS ON GASTROINTESTINAL CANCER 2018

JUN 20, 2018

45 CCA patients harboring FGF/FGFR aberrations (e.g., FGFR2 gene fusions, mutations, amplifications and re-arrangements)

28 patients with FGFR2 gene fusions, 71% tumor shrinkage, 7 pts achieved cPR, ORR 25%, 54% SD, DCR 79%.
17 patients with other FGF/FGFR aberrations 18% cPR.
13 patients who had received prior FGFR inhibitors, 31% achieved cPR.

Adverse events- most common - hyperphos (78%), AST (29%), dry skin (29%), diarrhea (27), dry mouth (27%). Grade ≥3 treatment-related AEs- 22%

TAS-120 demonstrated clinical activity CCA pts with FGFR2 gene fusions, and in patients who progressed on prior FGFR inhibitors.

PRESENTED BY: Andrew Zhu, MD, PhD
Massachusetts General Hospital Cancer Center, Harvard Medical School

Background

- HCC is the second most common cause of cancer-related mortality globally with high unmet need[1]
- Elevated AFP has been associated with poor prognosis and aggressive disease[2]
- Sorafenib (1L) and regorafenib (2L) are the only globally approved drugs for treatment of HCC.[3,4,5] Nivolumab (2L) is approved in the US based on a single arm phase 2 study.[6] Lenvatinib (1L) and cabozantinib (2L) have demonstrated benefits in phase 3 studies[7,8]
- Ramucirumab, a humanized IgG1 mAb, inhibits activation of VEGFR2[9]
- In the prior REACH study that evaluated ramucirumab in patients with advanced HCC, improvement of overall survival in the intent-to-treat population was not significant.[10] However, a survival benefit with ramucirumab was observed in the pre-specified population with baseline AFP ≥400 ng/mL (HR 0.674, P=0.006) and was well tolerated
- REACH-2 aimed to confirm the survival benefit of ramucirumab in patients with baseline AFP ≥400 ng/mL

Eligibility Criteria

Key Inclusion Criteria

- Diagnosis of HCC (histological or radiological imaging confirmation)
- BCLC stage C or B refractory or not amenable to locoregional therapy
- Child-Pugh Class A
- ECOG PS score of 0 or 1
- Baseline AFP ≥400 ng/mL
- Prior sorafenib treatment (discontinued due to progression or intolerance)
- Adequate hematologic and biochemical parameters

Key Exclusion Criteria

- Uncontrolled hypertension
- Esophageal or gastric varices requiring immediate intervention
- Prior anti-VEGF pathway therapy other than sorafenib
- Arterial thrombotic event within 6 months
- Therapeutic anticoagulation or chronic antiplatelet agents including NSAIDs
- History of or current hepatic encephalopathy (any grade) or ascites grade ≥2

Baseline Demographics and Characteristics

n, (%) except where indicated		Ramucirumab n=197	Placebo n=95	Total N=292
Sex	Male	154 (78.2)	79 (83.2)	233 (79.8)
Age	Median, years	64	64	64
ECOG PS	0	113 (57.4)	55 (57.9)	168 (57.5)
Geographic region	Americas, Europe, Israel, Australia	101 (51.3)	50 (52.6)	151 (51.7)
	Asia (excluding Japan)	55 (27.9)	27 (28.4)	82 (28.1)
	Japan	41 (20.8)	18 (18.9)	59 (20.2)
Child Pugh score	A-5	123 (62.4)	54 (56.8)	177 (60.6)
Baseline BCLC Stage	C	163 (82.7)	75 (78.9)	238 (81.5)
Etiology of liver disease	Hepatitis B	71 (36.0)	36 (37.9)	107 (36.6)
	Hepatitis C	48 (24.4)	28 (29.5)	76 (26.0)
	Significant Alcohol Use	48 (24.4)	21 (22.1)	69 (23.6)

Overall Survival

	Ramucirumab	Placebo	Difference	P-value
Patients / Events	197/147	95/74		
Median, months	8.5	7.3	1.2	
HR (95% CI)	0.710 (0.531, 0.949)			0.0199
Survival rate (%)				
12 months	36.8	30.3	6.5	0.2930
18 months	24.5	11.3	13.2	0.0187

Median durations of follow-up were

7.9 months for ramucirumab, 6.6 months for placebo

Adverse Events of Special Interest

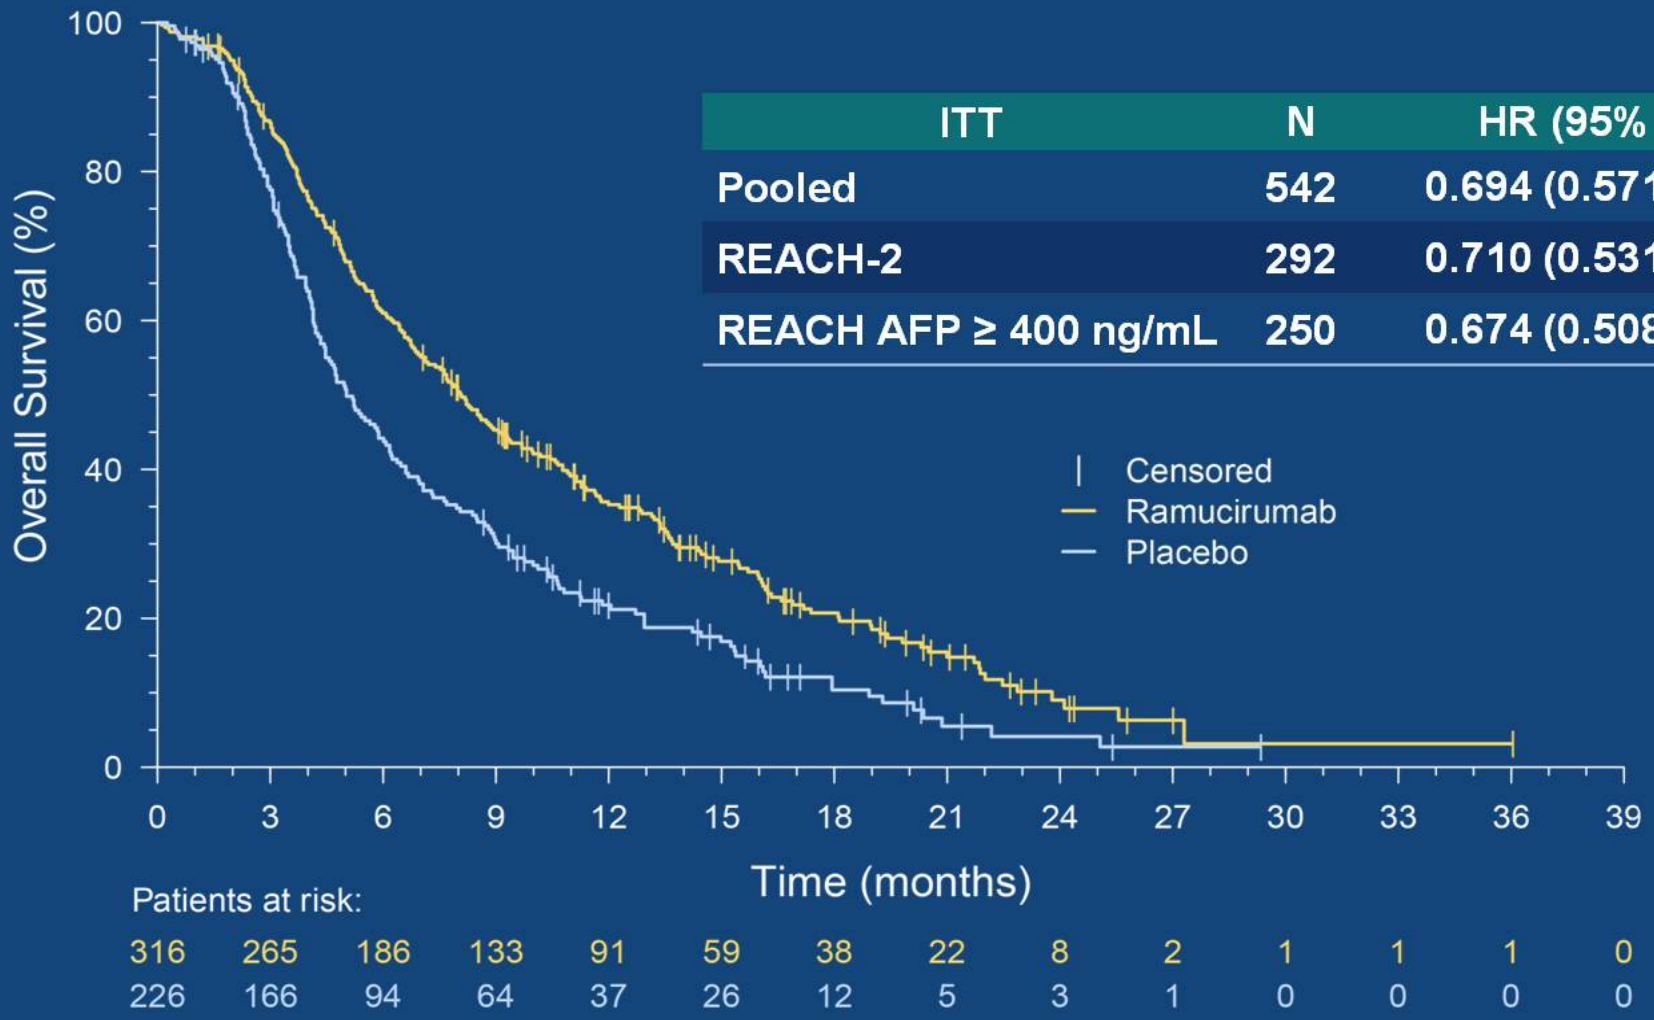
	Ramucirumab n=197		Placebo n=95	
n[a] (%)	Any Grade	Grade ≥3	Any Grade	Grade ≥3
Hypertension	49 (24.9)	25 (12.7)	12 (12.6)	5 (5.3)
Bleeding / Hemorrhage events	48 (24.4)	10 (5.1)	12 (12.6)	3 (3.2)
GI Hemorrhage events	12 (6.1)	7 (3.6)	5 (5.3)	2 (2.1)
Epistaxis	27 (13.7)	1 (0.5)	3 (3.2)	0
Proteinuria	40 (20.3)	4 (2.0)	4 (4.2)	0
Arterial thromboembolic events	5 (2.5)	3 (1.5)	1 (1.1)	1 (1.1)
Venous thromboembolic events	2 (1.0)	0	2 (2.1)	1 (1.1)
Gastrointestinal perforation	2 (1.0)	2 (1.0)	2 (2.1)	2 (2.1)
Congestive heart failure	1 (0.5)	1 (0.5)	1 (1.1)	1 (1.1)
Fistula	1 (0.5)	0	0	0
Liver injury / liver failure	78 (39.6)	36 (18.3)	28 (29.5)	15 (15.8)
Ascites	35 (17.8)	8 (4.1)	7 (7.4)	2 (2.1)
Hepatic encephalopathy	8 (4.1)	6 (3.0)	0	0
Infusion-related reactions[b]	17 (8.6)	0	3 (3.2)	0

[a]Adverse events of special interest according to either MEDRA preferred terms or consolidated categories, [b]Infusion-related reactions occurring within 24 hours of infusion

CONCLUSIONS

- REACH-2 met its primary endpoint showing a significant survival benefit of ramucirumab treatment in patients with HCC and AFP ≥400 ng/mL who progressed on or were intolerant to sorafenib
- Clinically meaningful benefits were demonstrated in secondary endpoints, including PFS and DCR
- Ramucirumab was well tolerated, with a safety profile consistent with monotherapy ramucirumab treatment
- REACH-2 is the first positive study in a biomarker-selected patient population, demonstrating a significant and meaningful OS benefit and favorable safety profile in HCC patients with baseline AFP ≥400 ng/mL, a population associated with poor prognosis
- REACH-2 confirms the efficacy and safety observed in the pre-specified group of patients from REACH with AFP ≥400 ng/mL

Overall Survival in Pooled Population



ITT	N	HR (95% CI)	mOS	P-value
Pooled	542	0.694 (0.571, 0.842)	Δ=+3.1 (8.1 vs. 5.0)	0.0002
REACH-2	292	0.710 (0.531, 0.949)	Δ=+1.2 (8.5 vs. 7.3)	0.0199
REACH AFP ≥ 400 ng/mL	250	0.674 (0.508, 0.895)	Δ=+3.6 (7.8 vs. 4.2)	0.0059

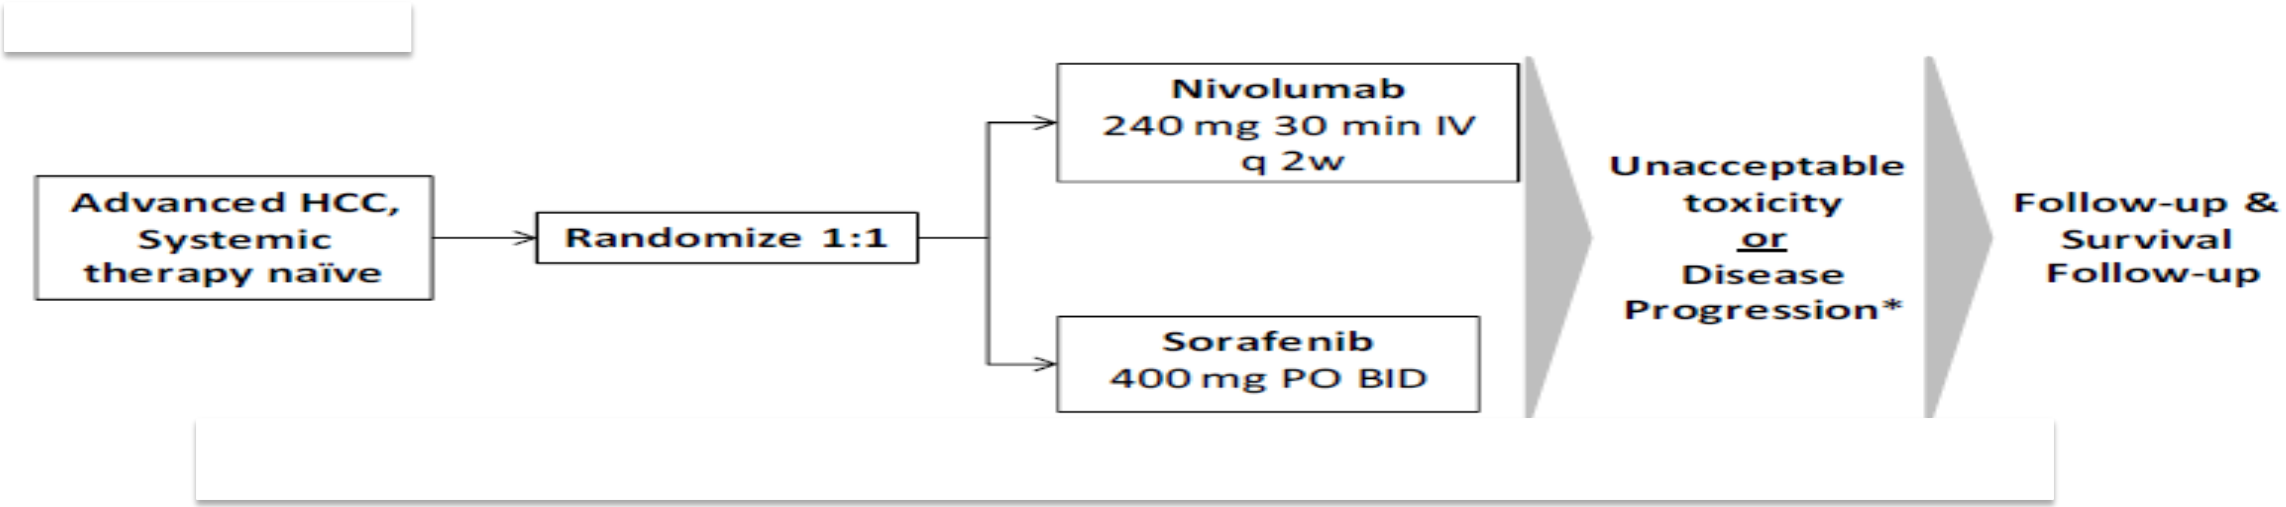
CheckMate-459: Nivolumab vs Sorafenib as First-line Treatment in Advanced HCC



Stratification factors:

- Etiology (HCV vs. non-HCV [ie, HBV- and HCC with no history of hepatitis virus infection])
- Vascular invasion &/or extrahepatic spread (present or absent),
- Geography (Asia vs Non-Asia).
