Primary & Metastatic Brain Tumors

TABLE 1. HISTOLOGIC CLASSIFICATION OF TUMORS OF THE CENTRAL NERVOUS SYSTEM.*

- **Tumors of neuroepithelial tissue**
- Astrocytic tumors
  - Astrocytoma
  - Anaplastic astrocytoma
  - Glioblastoma multiforme
  - Pilocytic astrocytoma
  - Pleomorphic xanthoastrocytoma
  - Subependymal giant-cell astrocytoma
- Oligodendroglial tumors
  - Oligodendroglioma
  - Anaplastic oligodendroglioma
- Mixed gliomas
- Pineocytoma
- Pineoblastoma
- Embryonal tumors
  - Medulloblastoma
  - Primitive neuroectodermal tumor

Table 3. Tumor Types, Metastatic Neurological Complications, and Percentage of Inpatients with Each Tumor Referred to Neurology Service

Primary Site	Pain Due To Bone Metastasis Only	Brain Metastasis	Epidural Extension or Metastasis	Tumor Plexopathy	Meningeal Metastasis	Paravertebral Radiculopathy	Base-of-Skull Metastasis	Total (Inpatient)	Admissions to MSKCC	Percentage of Inpatients Referred
Lung	18	64	11	3	10	4	2	153 (129)	821	15.7
Gynecological[b]	3	6	1	5	...	1	...	30 (20)	184	10.9
Other gastrointestinal[c]	1	...	2	...	...	...	...	29 (21)	325	6.5
						2	...	28 (27)	257	10.5
						...	2	18 (11)	129	8.5
						1	...	15 (13)	72	18.1
						...	...	9 (8)	55	14.5
						1	...	91 (73)	637	11.5
						23	22	855 (670)	5,147	

Primary Site	Pain Due To Bone Metastasis Only	Brain Metastasis	Epidural Extension or Metastasis	Tumor Plexopathy	Meningeal Metastasis	Paravertebral Radiculopathy	Base-of-Skull Metastasis
Lung	18	64	11	3	10	4	2

Impossible to Resect All Glioma Tumor Cells

- Invasive and infiltrative tumors
- Difficult to visualize tumor and perform maximal EOR
- Residual tumors cells outside of contrast enhancing margin
- Almost all recurrences local

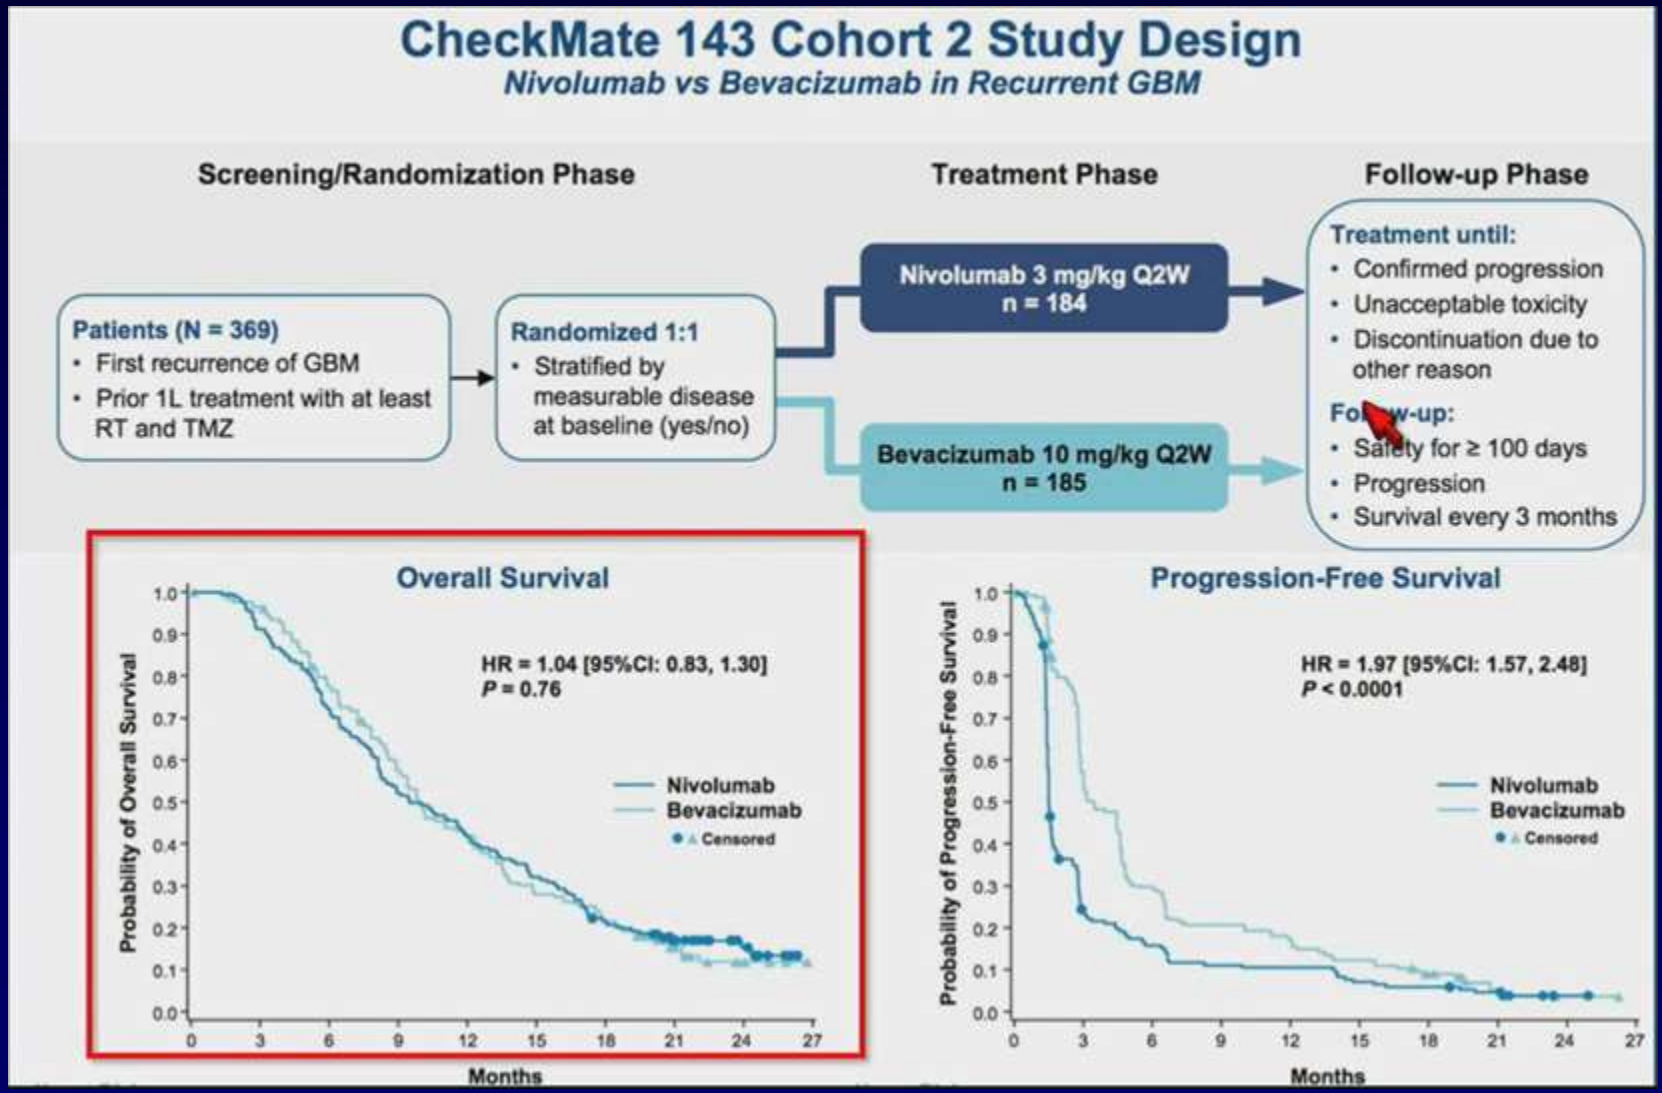
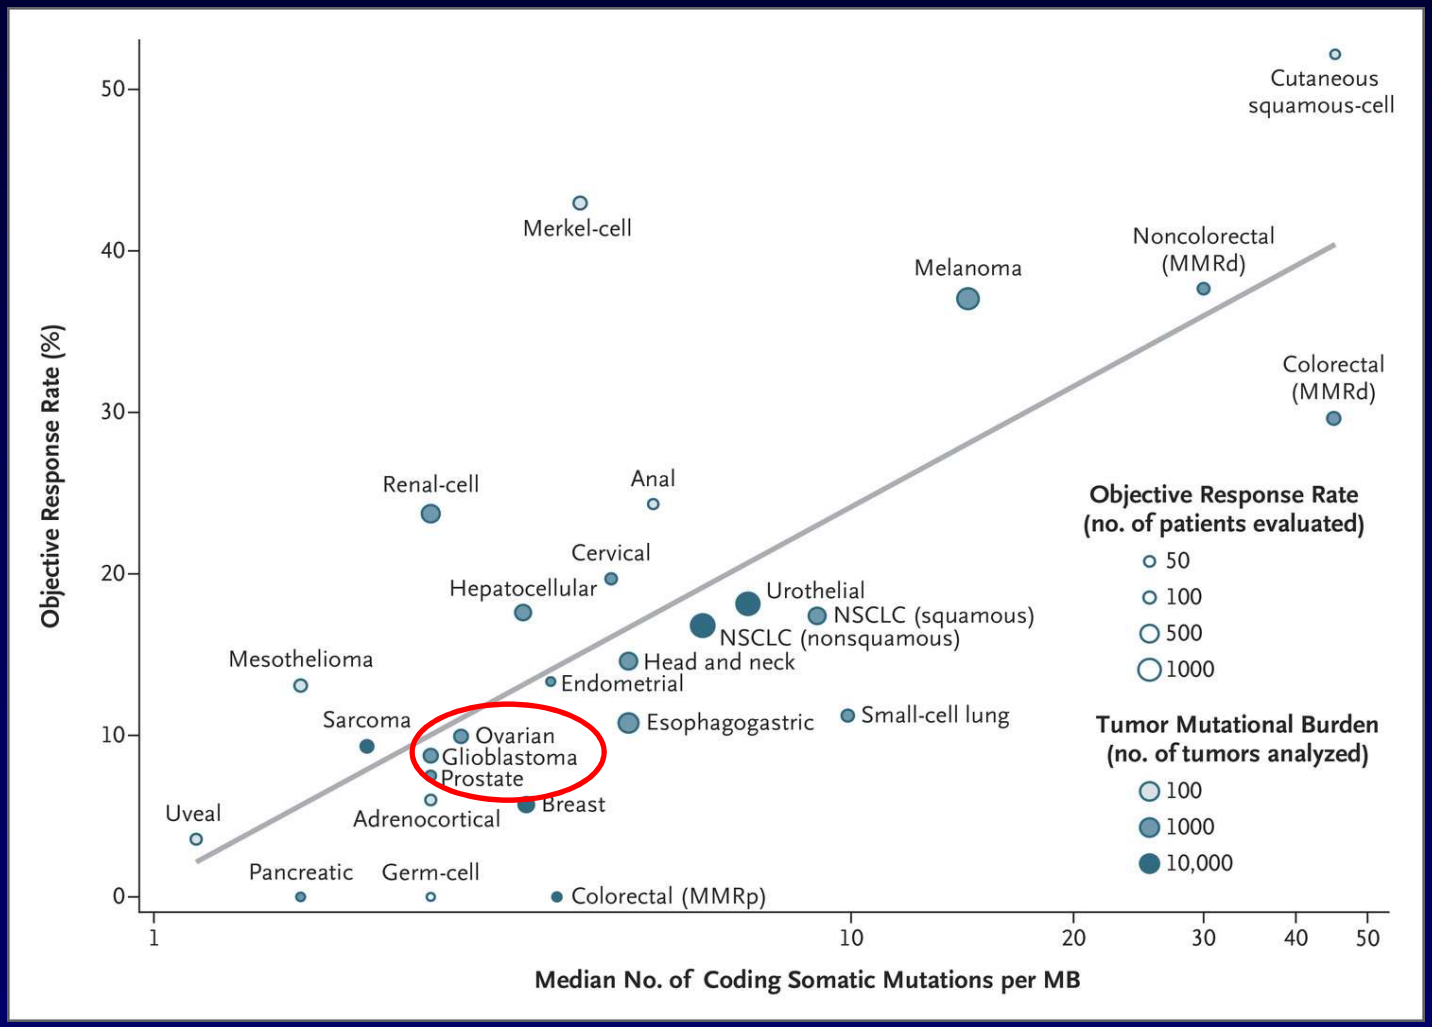
Nivolumab Failed to Improve Overall Survival of Patients with Recurrent Glioblastoma



Uhm J. Highlights of the Day Session 1, ASCO June 3, 2018.

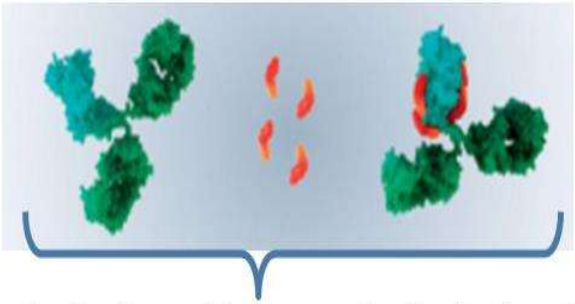
Correlation between Tumor Mutational Burden and Objective Response Rate with Anti–PD-1 or Anti–PD-L1 Therapy in 27 Tumor Types



Yarchoan M et al. *N Engl J Med* 2017;377:2500-2501.

The NEW ENGLAND JOURNAL of MEDICINE

Depatux-M (ABT-414) is a Monoclonal Antibody Drug Conjugate (ADC) Directed Against EGFR

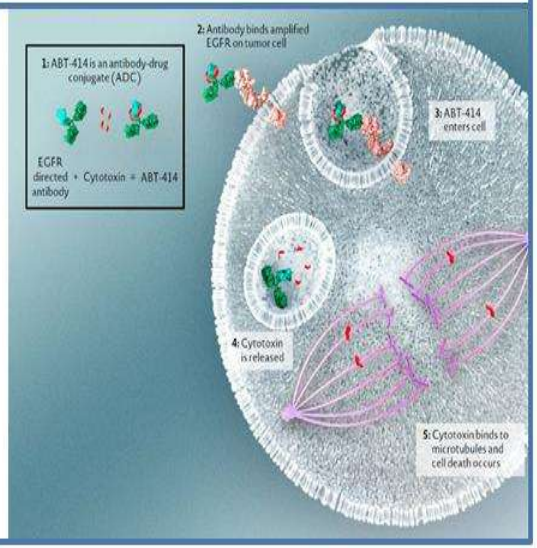


Antibody (ABT-806) + **Toxin (MMAF)** = **Antibody Drug Conjugate (Depatux-M)**

Depatux-M is an **antibody-drug conjugate (ADC),** comprised of an antibody that ***selectively targets activated EGFR*** and a cytotoxin that is **only released inside the *tumor* cell**

REF's: Gan HK, et al. *Cancer Res.* 2012;72(12):2924–2930, Doronina SO, et al. *Bioconjug Chem.* 2006;17(1):114-124, Trail PA. *Antibodies.* 2013;2:113-129.

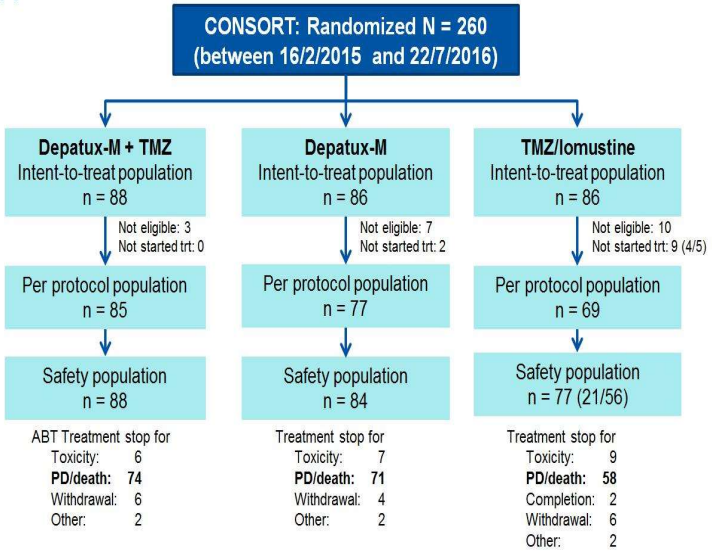
- EGFR amplification (~50% of GBM) leads to ***preferential exposure of a unique epitope*** of the EGFR protein that binds Depatux-M
- Unlike other EGFR directed therapies, there is **limited binding to EGFR in normal tissue** such as skin and other epithelial tissue.
- Depatux-M uses ***activated*** **EGFR** only as a target for **intracellular toxin delivery** and does not inhibit EGFR signaling; therefore, it can work in glioblastoma cells that are **resistant to classical EGFR inhibition**
- Phase I studies identified **EGFR amplification** as **biomarker for patient selection**



Disposition

Follow-up details at the time database lock (Oct 2018):

- Median follow-up for OS: 28.7 mo
- PD or died: 251
- **Died: 237 (91%)**
- Lost to follow-up: 4



Toxicity: Hematological, Ocular

*Stratified log-rank test by stratification factors at randomization.

Depatux-M in Recurrent EGFR ampl Glioblastoma

- Two phase I trial expansion cohorts demonstrated activity:
  - Depatux M monotherapy: ORR 6.8%, **6-mo PFS 29%** (n = 66)
  - Depatux M in combination with TMZ: ORR 14.3%, **6-mo PFS 25%** (n = 60)
- Dose limiting toxicity: **keratopathy**
- Two randomized trials to establish clinical activity:
  - INTELLANCE-2 study: in recurrent glioblastoma: conducted by EORTC, primary endpoint overall survival
    - Report 2017 SNO: 199 survival events
  - INTELLANCE-1 study: in newly diagnosed glioblastoma, conducted by NRG foundation

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use AFINITOR safely and effectively. See full prescribing information for AFINITOR.

AFINITOR (everolimus) tablets for oral administration
Initial U.S. Approval: 2009

----------INDICATIONS AND USAGE----------

AFINITOR is a kinase inhibitor indicated for the treatment of:

- postmenopausal women negative breast cancer (exemestane after failur
- adults with progressive that is unresectable, loc effectiveness of AFINI tumors have not been e
- adults with advanced re with sunitinib or sorafe
- adults with renal angio not requiring immediat treatment of renal angi objective responses in follow-up of patients is
- adults and children ≥ 3 astrocytoma (SEGA) a therapeutic interventio resection. The effective change in SEGA volume. Clinical benefit such as improvement in disease-related symptoms or increase in overall survival has not been demonstrated. (1.5)

----------DOSAGE AND ADMINISTRATION----------

Advanced HR+ BC, advanced PNET, advanced RCC, or renal angiomyolipoma with TSC:

- 10 mg once daily with or without food. (2.1)

AFINITOR dose by approximately 50%. Subsequent dosing should be based on therapeutic drug monitoring (TDM). (2.4)

- If strong inducers of CYP3A4 are required, double the AFINITOR dose. Subsequent dosing should be based on TDM. (2.4)

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use ZORTRESS® (everolimus) safely and effectively. See full prescribing information for ZORTRESS.

ZORTRESS (everolimus) tablets for oral use.
Initial U.S. Approval: 2010

----------DOSAGE AND ADMINISTRATION----------

- Kidney transplantation: starting oral dose of 0.75 mg twice daily as soon as possible after transplantation. (2.1)
- Liver transplantation: starting oral dose of 1.0 mg twice daily starting 30 days after transplantation. (2.2)

----------DOSAGE AND ADMINISTRATION----------

- Kidney transplantation: starting oral dose of 0.75 mg twice daily as soon as possible after transplantation. (2.1)
- Liver transplantation: starting oral dose of 1.0 mg twice daily starting 30

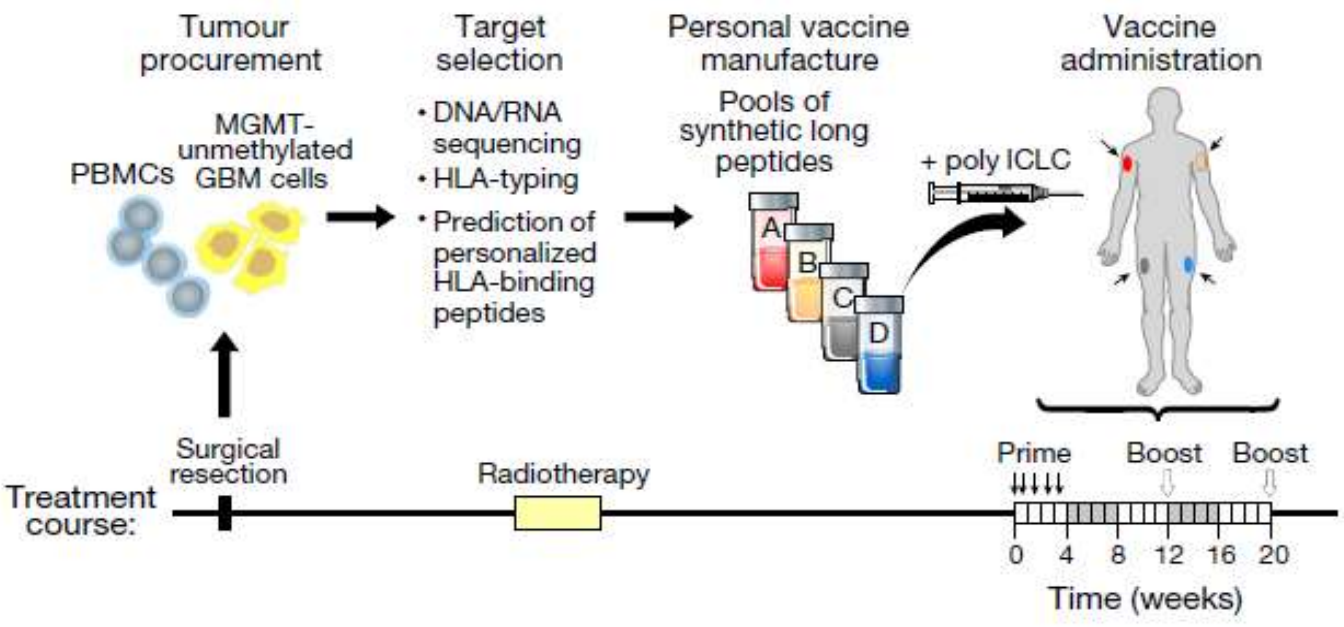
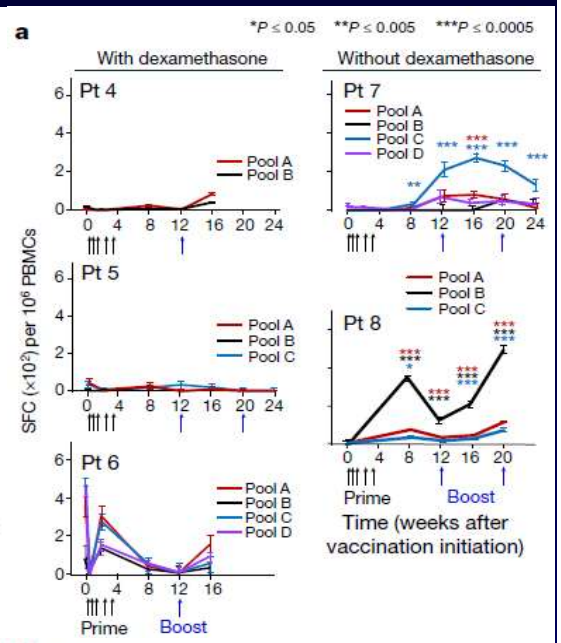
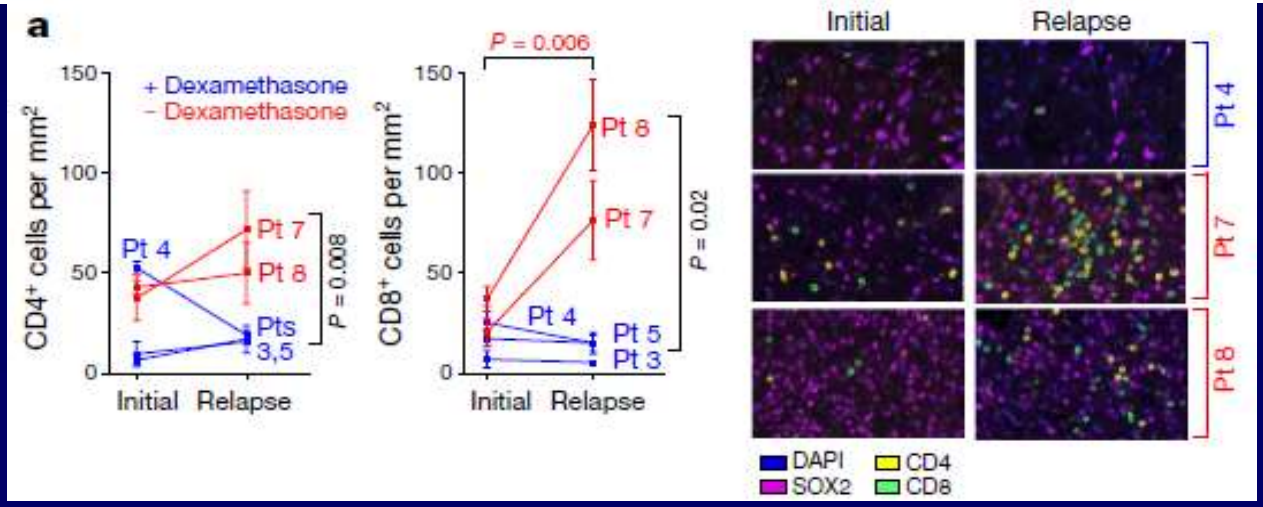
Dexamethasone Attentuates Personalized Neoantigen Vaccines in Glioblastoma





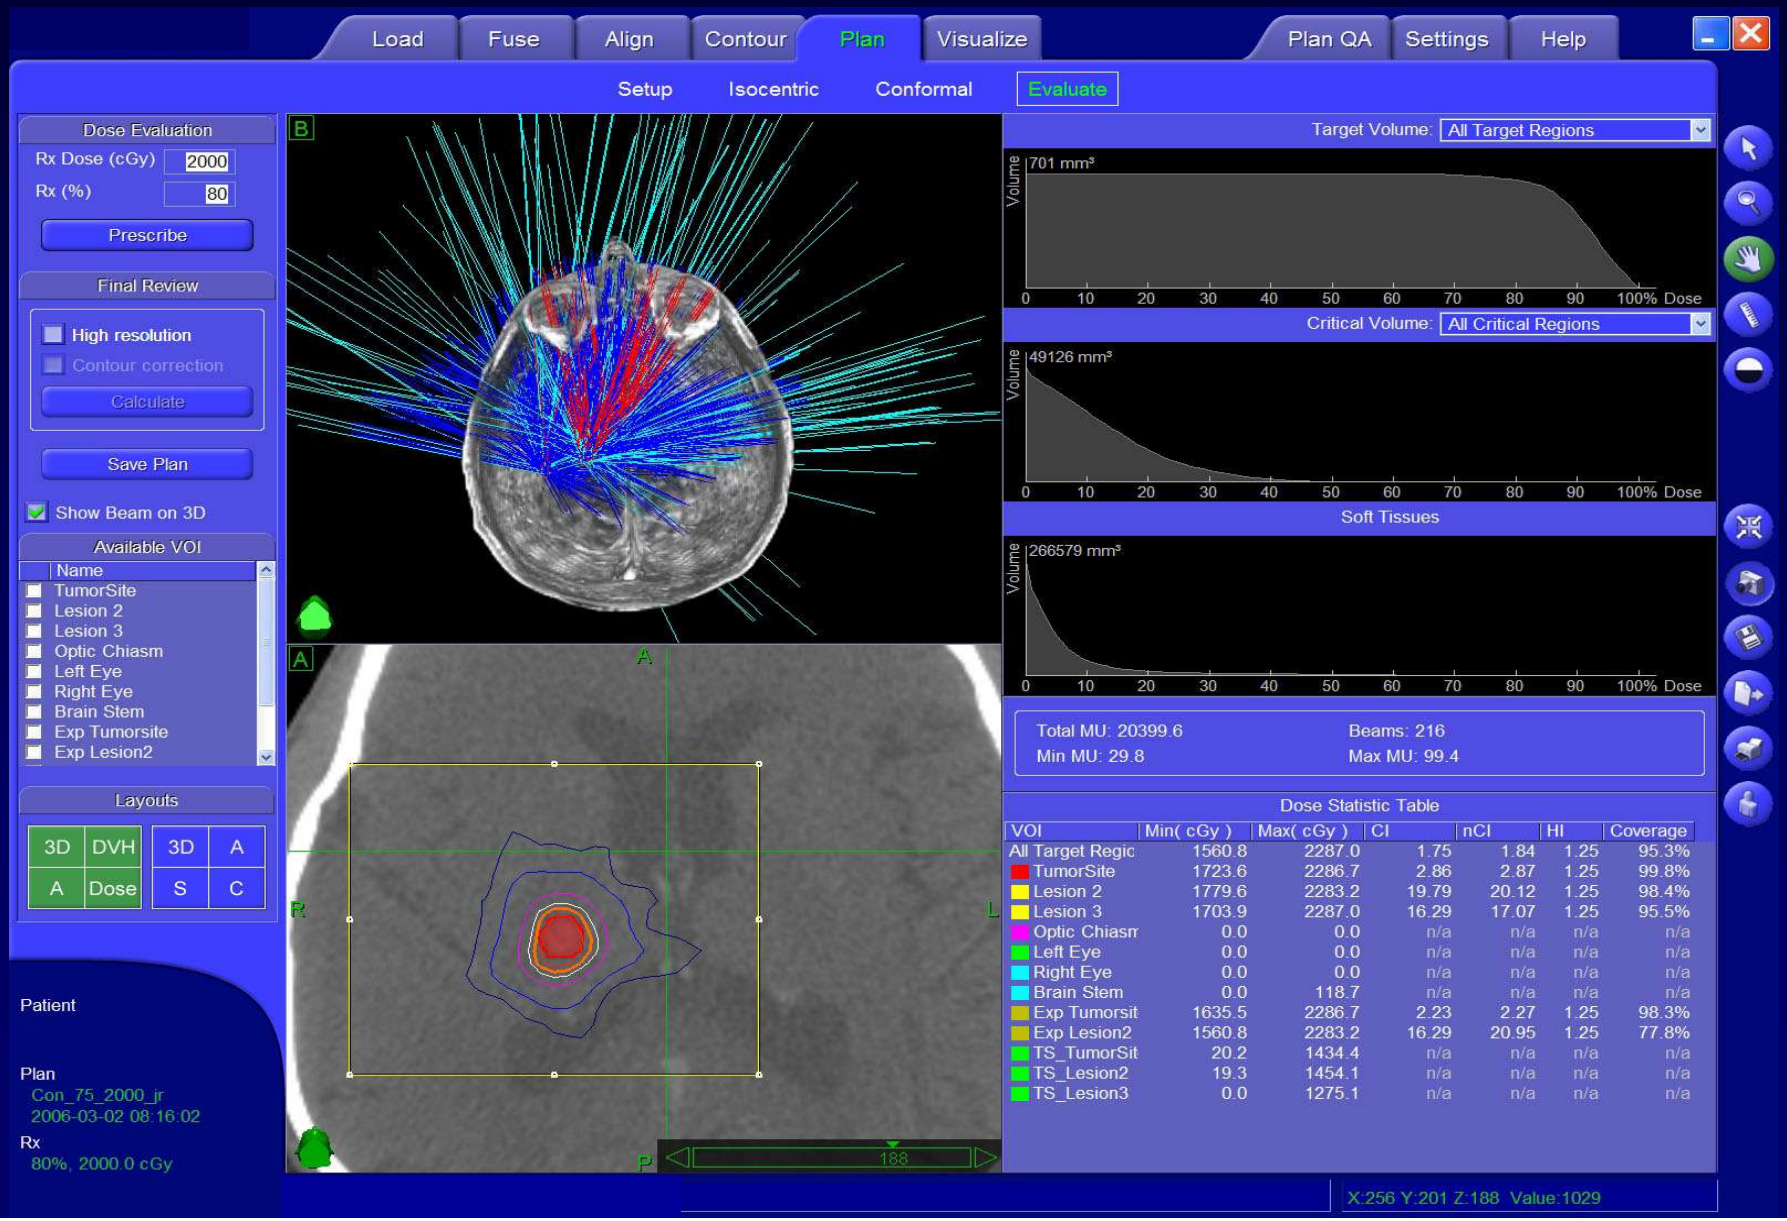


Keskin DB, Anandappa AJ, Sun J, et al. *Nature* 2019;565(5):1458-1471.

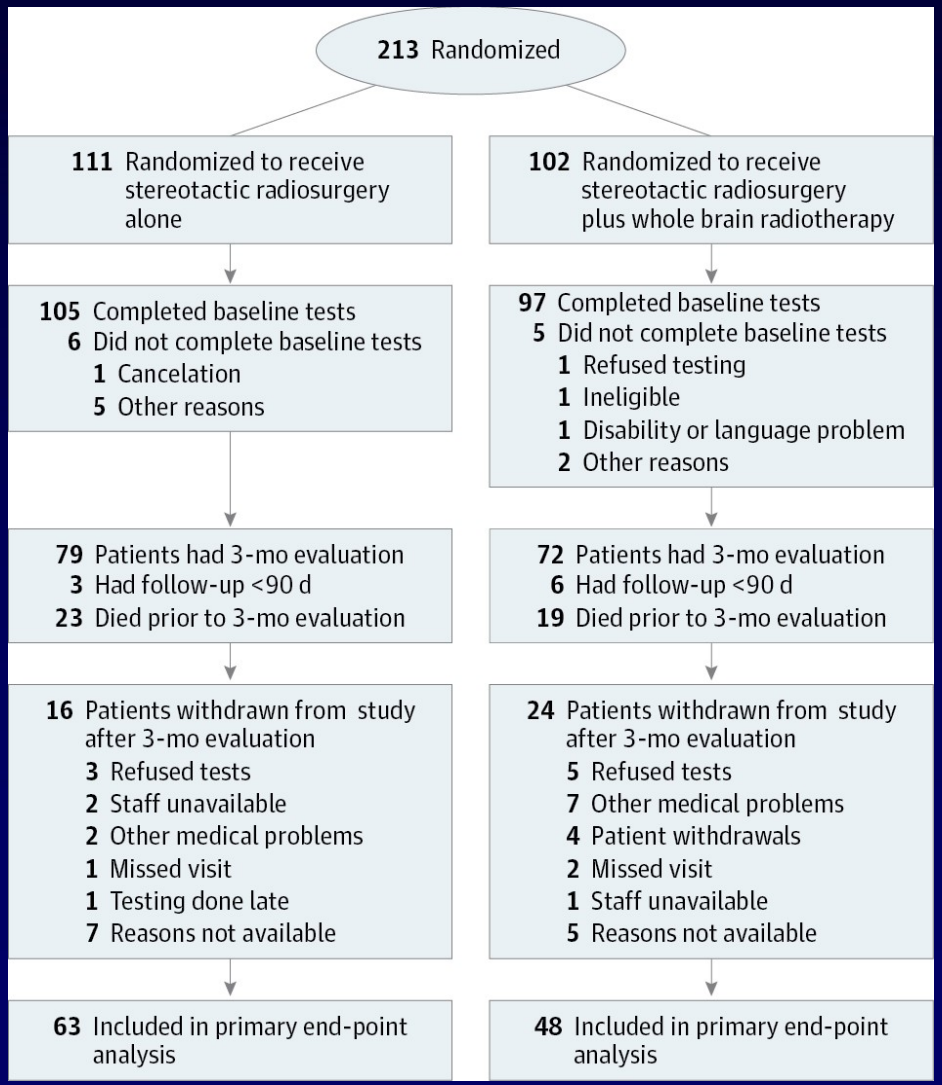
Update on the Management of Malignant Gliomas

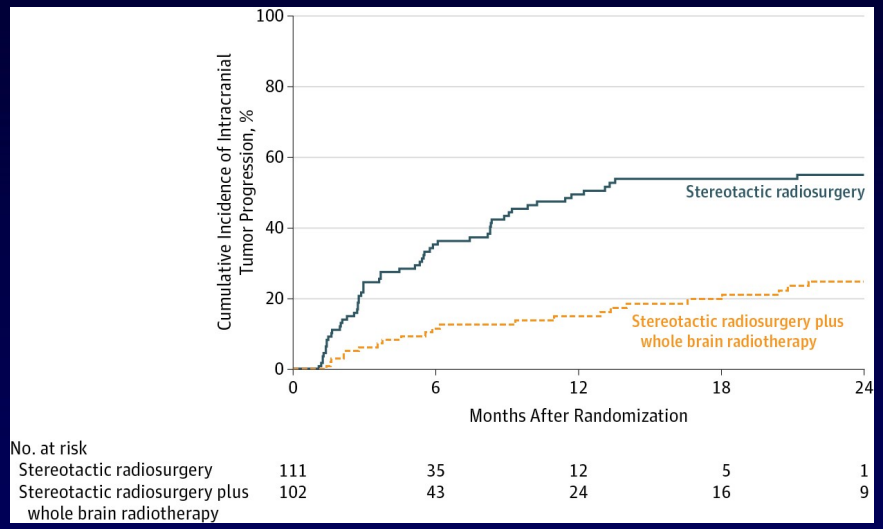
- Temozolomide added to radiation has been the standard-of-care for newly diagnosed glioblastoma since 2005.
- Adjuvant Tumor Treating Fields therapy was approved by the FDA in 2015 for newly diagnosed glioblastoma.
- Bevacizumab received final approval by the FDA for use in recurrent glioblastoma in 2017.
- Targeted therapy or checkpoint inhibitors offer no survival advantage to glioblastoma patients.
- Dexamethasone interferes with treatments against glioblastoma.

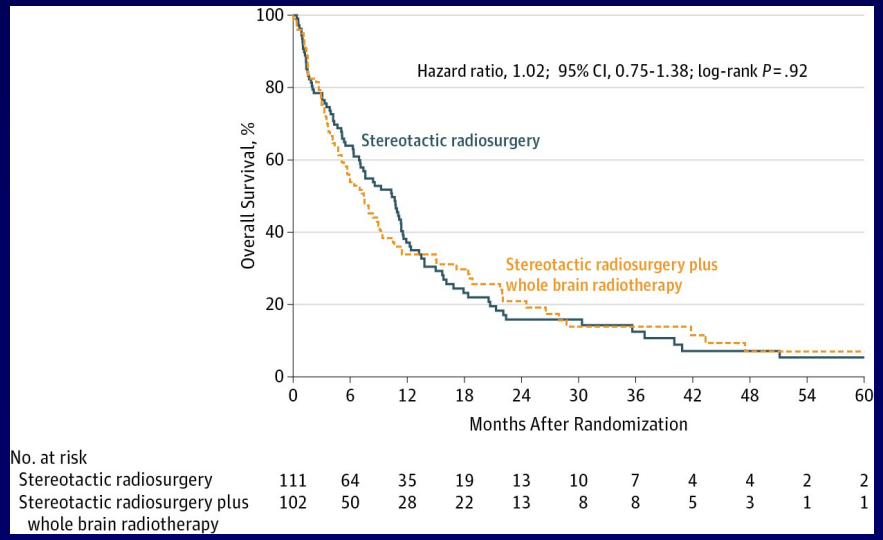
Stereotactic Radiosurgery for Brain Metastasis



SRS vs SRS + WBXT for Patients with 1-3 Brain Metastases (60-70% NSCLC)







Brown PD, et al. *JAMA* 2016;316(4):401-409.

SRS vs SRS + WBXT for Patients with 1-3 Brain Metastases (60-70% NSCLC)

Table 2. Patients Who Experienced Cognitive Deterioration by 3 Months and Difference Between Groups

	No. (%) of Participants			
	SRS Alone (n = 63)	SRS Plus WBRT (n = 48)	Mean Difference, % (95% CI)	*P* Value[a]
Change from baseline[b]

Management of Brain Metastases from Non-Small Cell Lung Cancer

- SRS is preferred for the preservation of neurocognitive function in patients with oligometastases.
- Whole brain radiotherapy is reserved for those with multiple brain metastases or poor performance status.
- Targeted therapy are becoming the first-line treatment in oncogene-addicted NSCLC patients with no or minimal symptoms
