The heat wave of an anti-tumor response- Karen Karlsson

Updates in Immunotherapy in Breast Cancer

Evanthia Roussos Torres

Assistant Professor of Medicine, Oncology

Norris Comprehensive Cancer Center

Keck School of Medicine, USC

California Cancer Consortium Conference, Pasadena

August 24, 2024

Outline

- I. Background on immunotherapy
- II. Clinical trials in breast cancer → recent approvals / standard of care
- III. Areas of ongoing research
- IV. Summary / Questions

Objectives

- Review basics of immune checkpoint inhibition and relevant clinical trials leading to approval for use in breast cancer
- Discuss ongoing research in the field of checkpoint inhibition in breast cancer

I. Background: Immune checkpoints in cancer

- Types of immunotherapy
 - Cancer Vaccines
 - Adoptive Cellular Therapy (ACT)
 - Immune Checkpoint Blockade
- Checkpoints control T cell activation through various mechanisms
- PD1/PDL1 blockade active in many cancers
- Breast cancer historically considered to have a “cold” immunophenotype in part due to immunosuppression

Santa-Maria et al. Expert Rev Anticancer Ther 2015

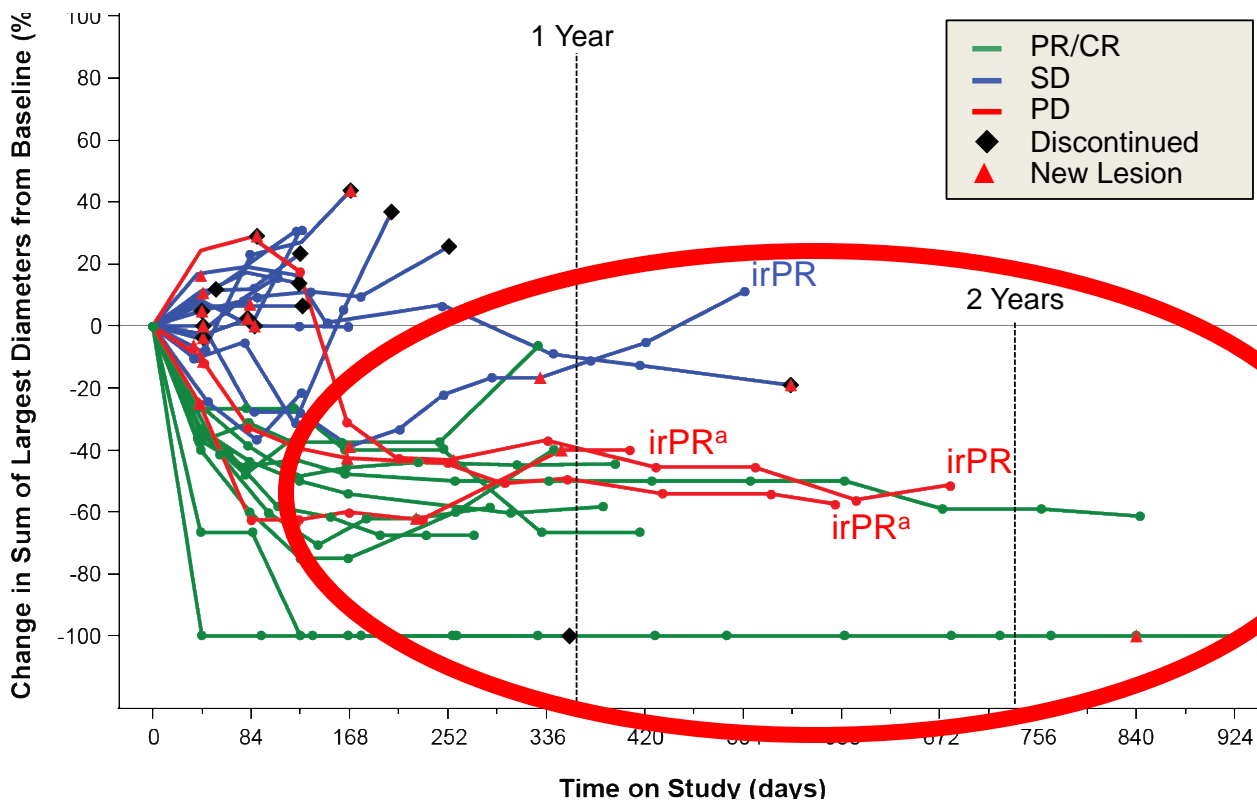

THE ROAD TO CANCER IMMUNITY: "IF A CAR IS SITTING AT THE TOP OF A HILL WITH THE FRONT POINTING DOWNHILL, IT MAY ONLY NEED THE PARKING BRAKE RELEASED TO START MOVING. ANOTHER CAR SITTING ON A FLAT ROAD MAY NEED THE BRAKE RELEASED AND A PUSH TO GET GOING. A CAR SITTING AT THE BOTTOM OF A HILL AND FACING UPHILL WILL NEED THE BRAKE RELEASED AND A LOT OF GAS TO GET MOVING," SAYS DREW PARDOLL, DIRECTOR, THE BLOOMBERG-KIMMEL INSTITUTE FOR CANCER IMMUNOTHERAPY

II. Clinical trials in METASTATIC breast cancer:

Checkpoint blockade confers durable responses...

Atezolizumab

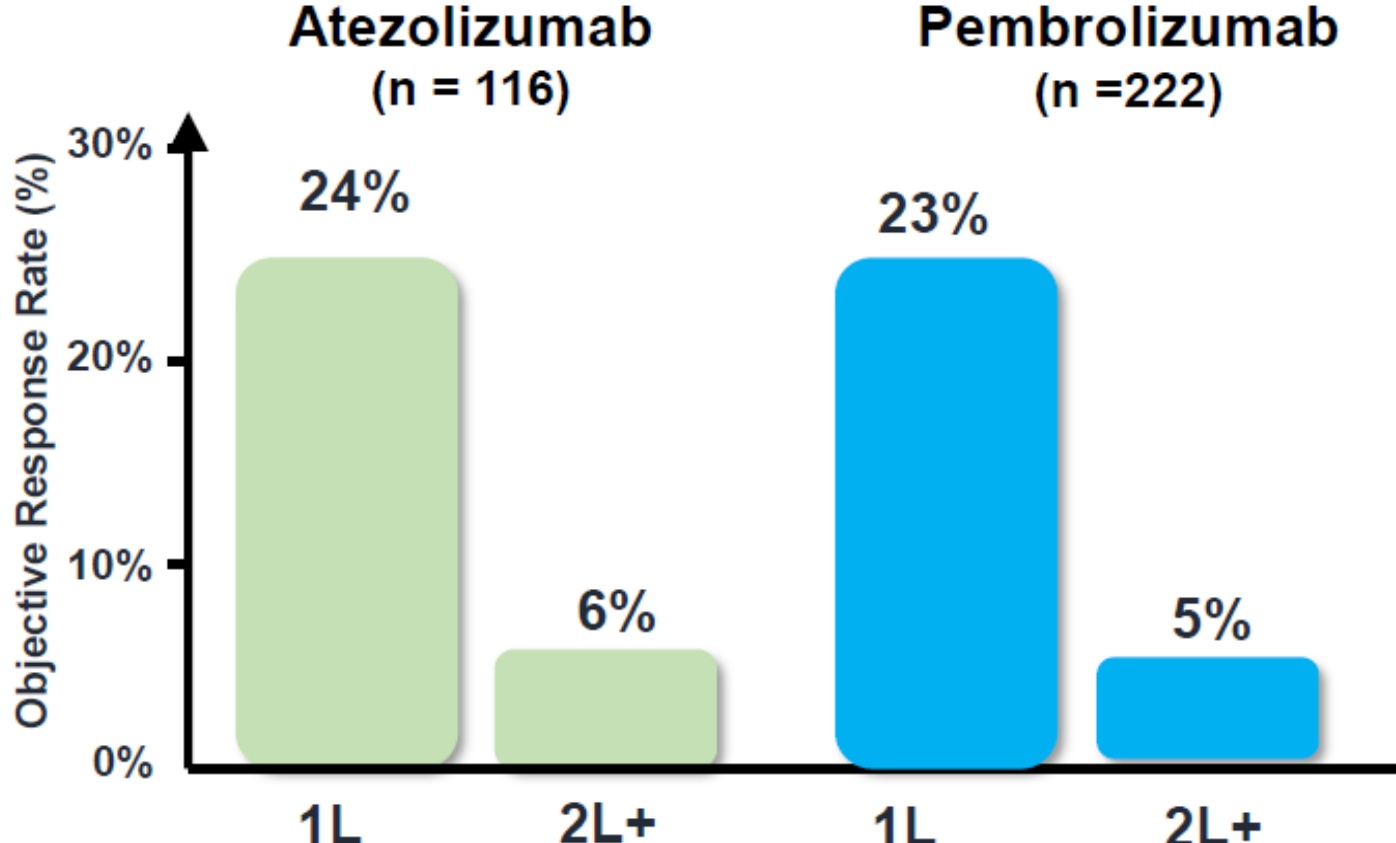

Schmid et al. AACR 2017;
Emens JAMA Oncol 2018

Pembrolizumab

Nanda et al. JCO 2016;34:2460-7

Lack of robust response to single agent therapy:

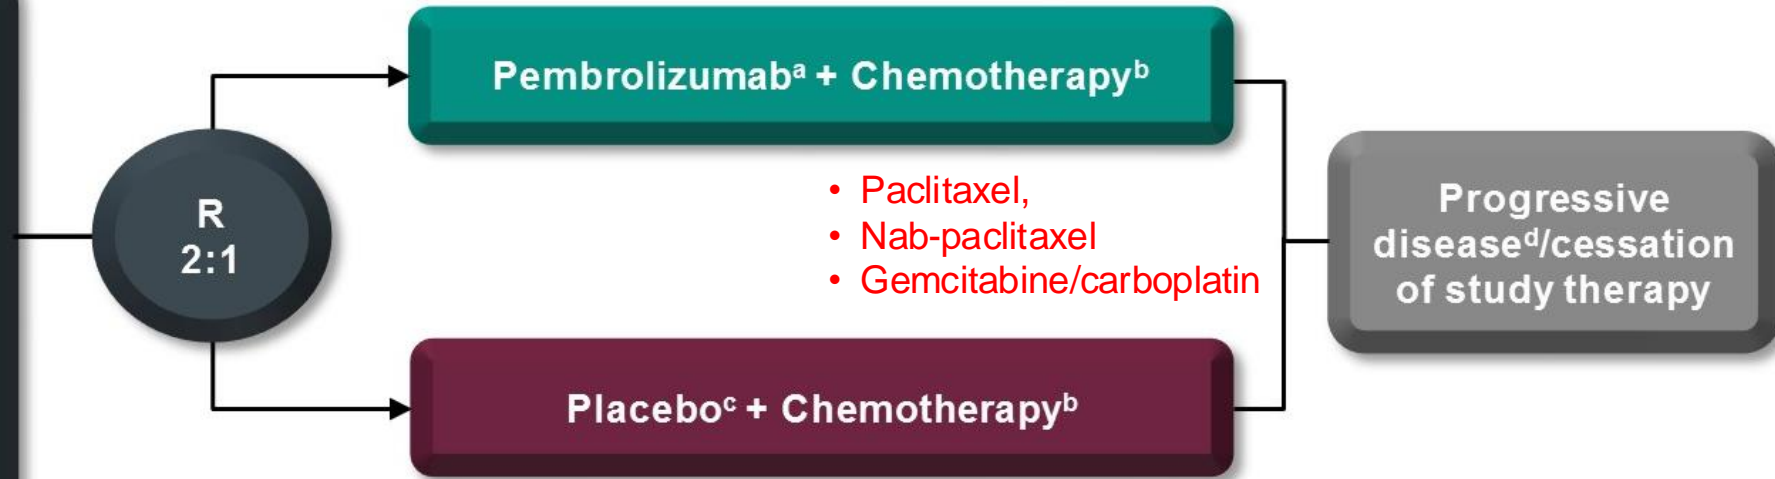

| Metastatic Population | Agent | Evaluable (N) | ORR |
|-----------------------|---------------|---------------|-----|
| TNBC | Avelumab | 58 | 5% |
| HER2+ | Avelumab | 26 | 0% |
| HR+ HER2- | Pembrolizumab | 25 | 12% |
| | Avelumab | 72 | 3% |

Emens JAMA Oncol 2018; Adams et al. SABCS 2017; Dirix Breast Cancer Res Treat 2018; Rugo Clin Cancer Res 2018.

KEYNOTE-355 Study Design (NCT02819518)

Key Eligibility Criteria

- Age ≥ 18 years
- Central determination of TNBC and PD-L1 expression
- Previously untreated locally recurrent inoperable or metastatic TNBC
- Completion of treatment with curative intent ≥ 6 months prior to first disease recurrence
- ECOG performance status 0 or 1
- Life expectancy ≥ 12 weeks from randomization
- Adequate organ function
- No systemic steroids
- No active CNS metastases
- No active autoimmune disease

Stratification Factors:

- Chemotherapy on study (taxane vs gemcitabine/carboplatin)
- PD-L1 tumor expression (CPS ≥ 1 vs CPS < 1)
- Prior treatment with same class chemotherapy in the neoadjuvant or adjuvant setting (yes vs no)

KEYNOTE-355

Progression-Free Survival: PD-L1 CPS ≥ 1

*Prespecified P value boundary of 0.00111 not met. Hazard ratio (CI) analyzed based on a Cox regression model with treatment as a covariate stratified by the randomization stratification factors. Data cutoff December 11, 2019.

| Subgroup | No. of Patients | Median Overall Survival | | Hazard Ratio for Death (95% CI) | |
|------------------------|-----------------|----------------------------------|----------------------------|---------------------------------|-------------|
| | | Pembrolizumab-chemotherapy mo | Placebo-chemotherapy mo | | |
| Overall | 847 | 17.2 | 15.5 | 0.89 | (0.76–1.05) |
| PD-L1 CPS cutoff of 1 | | | | | |
| CPS ≥ 1 | 636 | 17.6 | 16.0 | 0.86 | (0.72–1.04) |
| CPS < 1 | 211 | 16.2 | 14.7 | 0.97 | (0.72–1.32) |
| PD-L1 CPS cutoff of 10 | | | | | |
| CPS ≥ 10 | 323 | 23.0 | 16.1 | 0.71 | (0.54–0.93) |
| CPS < 10 | 524 | 14.7 | 15.2 | 1.04 | (0.85–1.26) |
| PD-L1 CPS cutoff of 20 | | | | | |
| CPS ≥ 20 | 204 | 24.0 | 15.6 | 0.72 | (0.51–1.01) |
| CPS < 20 | 643 | 15.9 | 15.5 | 0.96 | (0.80–1.14) |

 Cortes et al. NEJM 2022

FDA-Approval

On 11/13/20, the FDA granted accelerated approval to **pembrolizumab** in combination with chemotherapy for patients with unresectable or metastatic TNBC whose tumors express **PD-L1 (CPS \geq 10)** as determined by an FDA-approved test.

What about the early-stage disease?

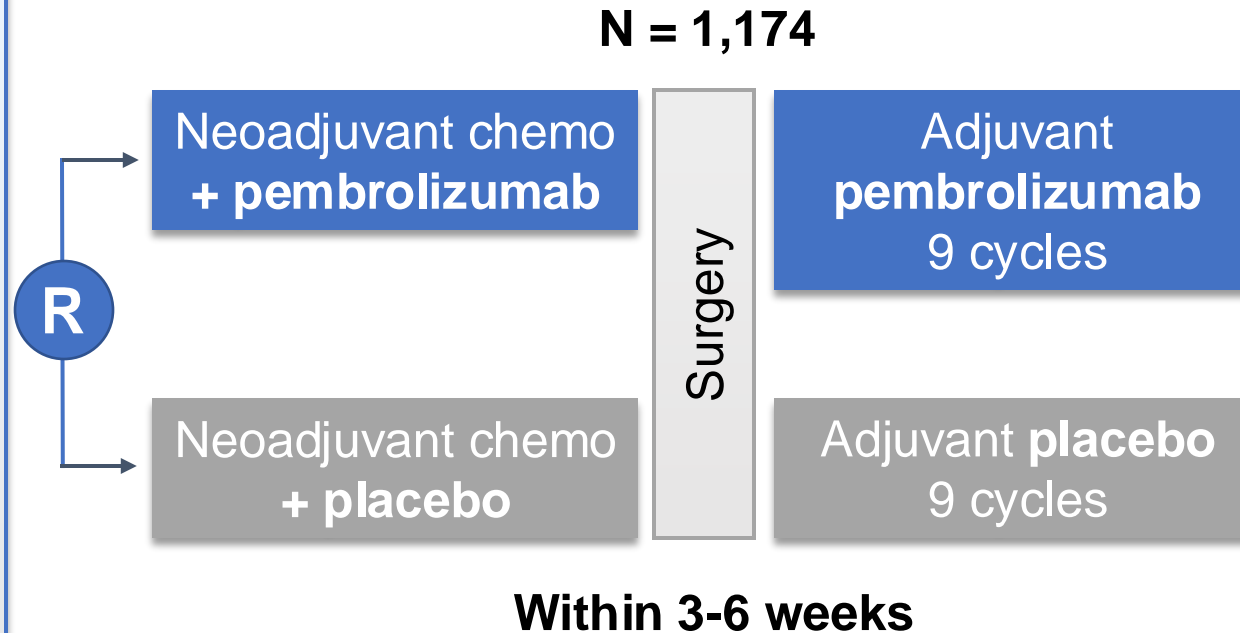

KEYNOTE-522

Eligibility

- Newly diagnosed TNBC (central confirmation)
- T1c N+ or T \geq 2 N0-2
- PD-L1+ or PD-L1-

Stratification

- T1/T2 vs T3/T4
- N0 vs N+
- Carboplatin Q1W vs Q3W

Primary endpoints

- pCR rate (ypT0/Tis ypN0)
- EFS

Secondary endpoints

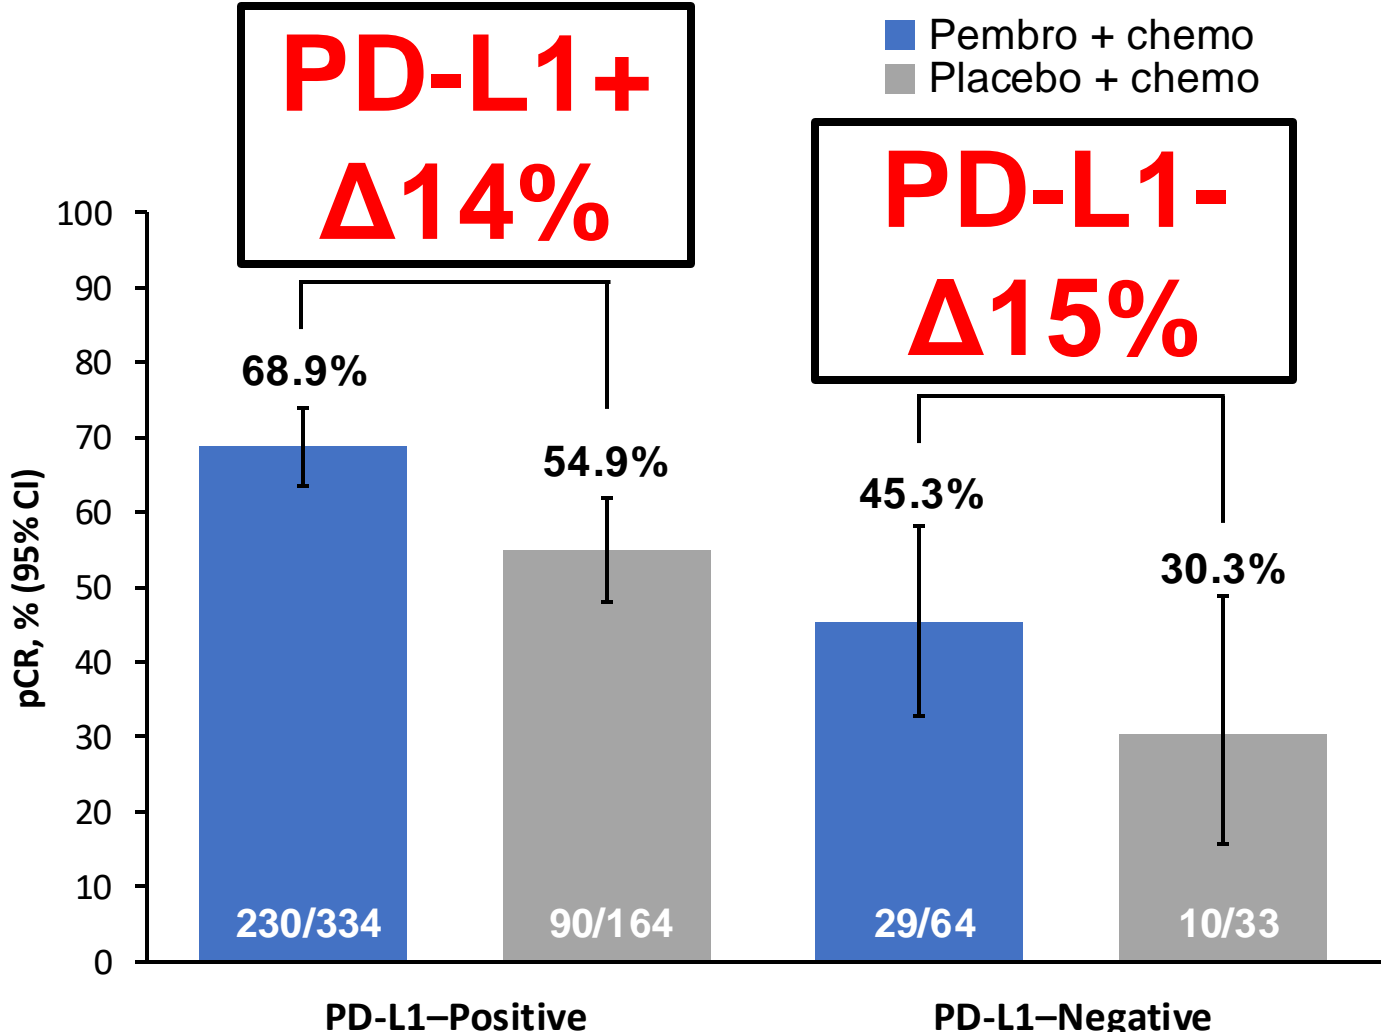

- Alternative pCR rate (ypT0 ypN0)
- pCR rate in PD-L1+
- EFS in PD-L1+
- OS

Study Treatment

Paclitaxel 80 mg/m² IV weekly
 Carboplatin weekly (AUC 1.5) or Q3W (AUC5)
 Doxorubicin 60 mg/m² IV Q3W
 (Epirubicin 90 mg/m² IV Q3W)
 Cyclophosphamide 600 mg/m² IV Q3W
 Pembrolizumab 200 mg IV Q3W

KEYNOTE-522: Higher pathologic complete response (pCR) at interim analysis 1

Schmid P et al. NEJM 2019.

KEYNOTE-522: EFS update at interim analysis at 63 months

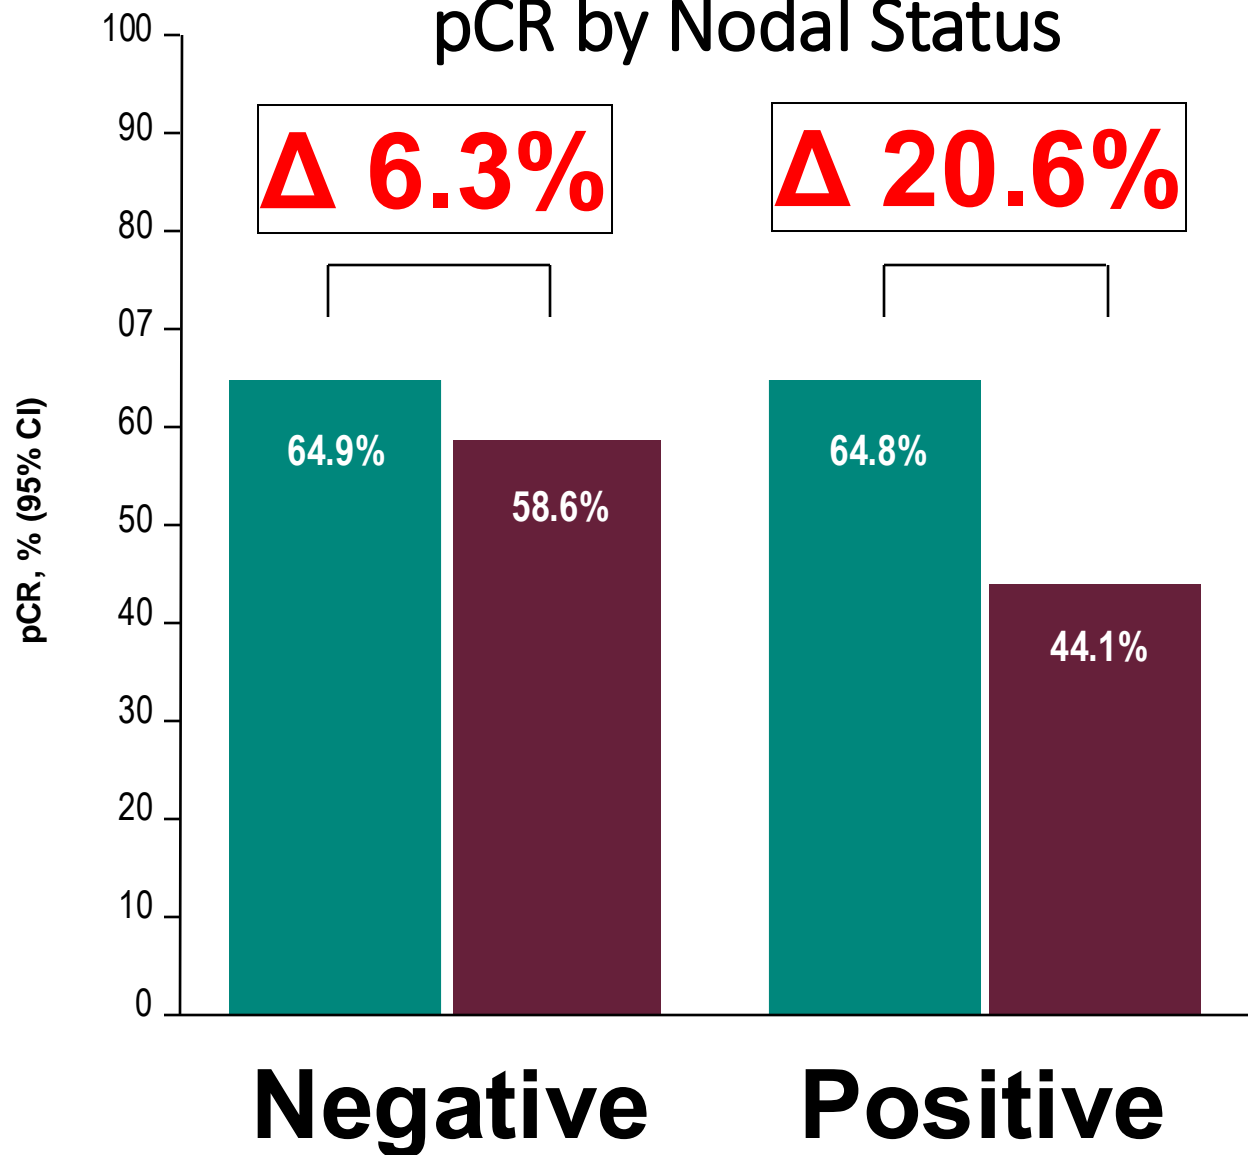

No. at Risk

1st immunotherapy-based regimen demonstrating a statistically significant OS benefit in patients with high-risk early-stage TNBC—ESMO 2023

FDA-Approval

On **7/27/21** **July 27, 2021**, the FDA approved pembrolizumab for high-risk early-stage TNBC with chemotherapy as neoadjuvant treatment and then continued as a single agent as adjuvant treatment after surgery

Based on KEYNOTE-522, the indication for palliative pembrolizumab was converted from accelerated to full approval

FDA-Approval

On **7/27/21 July 27, 2021**, the FDA approved **trastuzumab** for high-risk early-stage TNBC with **trastuzumab** as adjuvant treatment and then continued **trastuzumab** as adjuvant treatment after surgery.

NEW SOC!!
BUT MANY NEW QUESTIONS!

Based on this indication for palliative treatment, the indication was converted from accelerated to full approval.

Studies to watch for HR+ disease:

- 1. CheckMate-7FL-LBA20** A randomized, double-blind trial of nivolumab (NIVO) vs placebo (PBO) with neoadjuvant chemotherapy (NACT) followed by adjuvant endocrine therapy (ET) ± NIVO in patients (pts) with high-risk, ER+ HER2– primary breast cancer (BC)
 1. pCR increased significantly in the nivolumab arm to 24.5% versus 13.8% in the control (P = .0021)
 2. PD-L1+ subset pCR rates increased from 20.2% to 44.3% (odds ratio [OR], 3.11 [95% CI, 1.58 to 6.11])
 3. PD-L1–negative cancers, pCR rates 14.2% versus 10.7%.
(Loi et al Annals of Onc 2023).
- 2. KEYNOTE-756** -pembrolizumab plus T-AC or placebo plus T-AC followed by surgery and continued pembrolizumab or placebo for 6 months and endocrine therapy for up to 10 years.
 1. pCR rate improved from 15.6% in the control arm to 24.3% in the pembrolizumab arm (P = .00005).
 2. PD-L1+ subpopulation, 29.7% versus 19.6%
 3. PD-L1–negative cancers, 7.2% versus 2.6%.
 4. The EFS results were immature and continue to be evaluated.
- 3. iSPY2**—
 1. Three different immunotherapy arms demonstrated improved pCR rates with neoadjuvant immune checkpoint therapy in MammaPrint high ER+/HER2– cancers.
 2. Further molecular analysis revealed that among these cancers, only the MammaPrint High-2 (or MP2) subset had improvement in pCR rate.
 3. Integrating CDK4/6 inhibitors in adjuvant and neoadjuvant settings further enhances efficacy

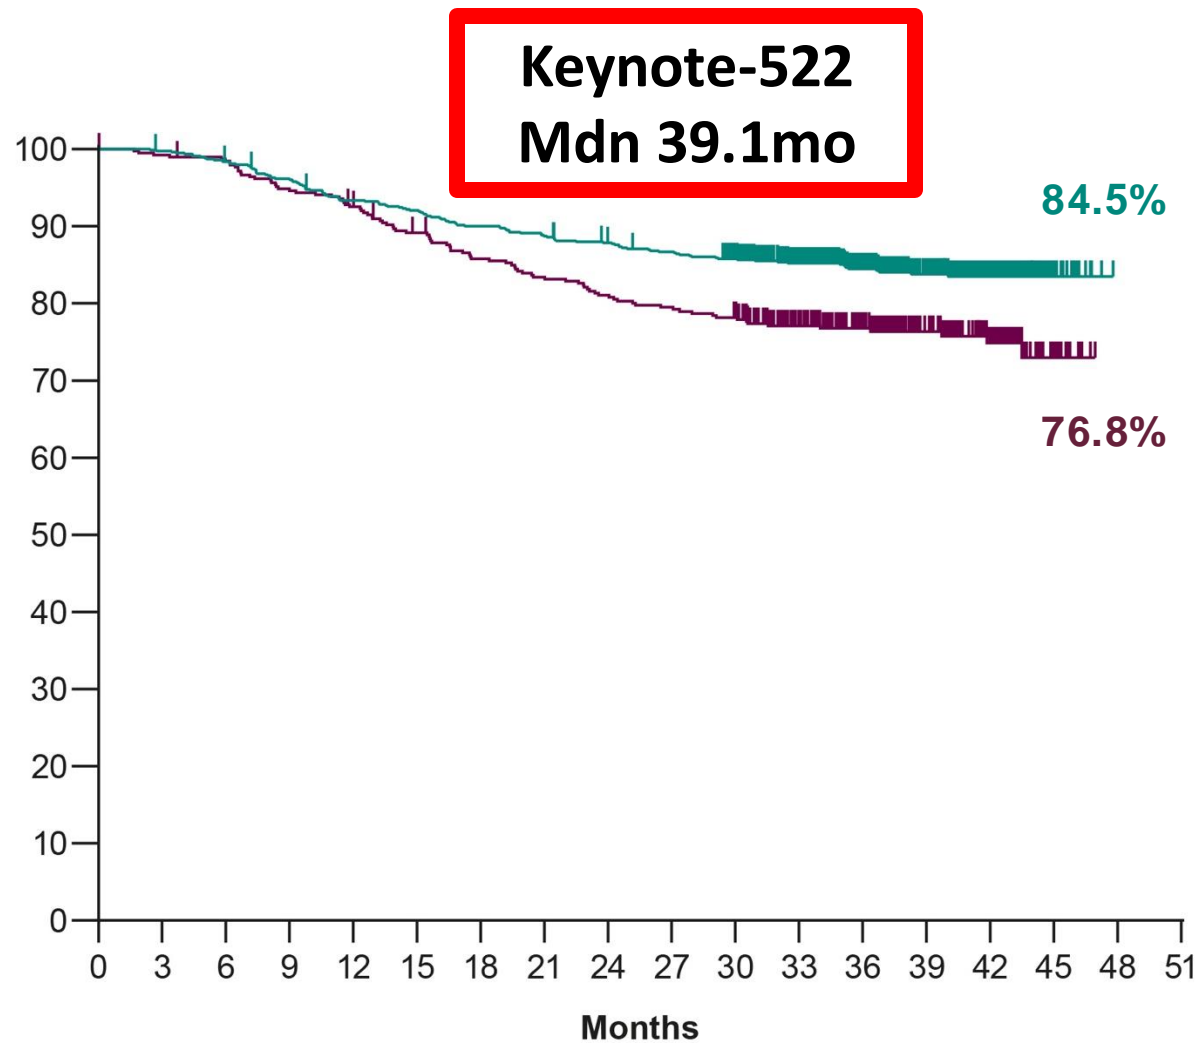

In combination with CDK4/6?

| Study | Recruitment Status | Treatment | Study Population | End Point |
|--|--------------------|---|---|---|
| I-SPY2 (NCT01042379) Bayesian Adaptive phase II | Recruiting | Multiple arms; see: NCT01042379 | cT2, MP high | pCR rate |
| Neo-CheckRay (NCT03875573) phase II | Recruiting | Durvalumab + oleclumab + AC + paclitaxel followed by preoperative radiation | cT1-3 cN-1, ER+/HER2-, Ki67 ≥15% or grade 3, or MP high risk | Safety run-in, tumor response, pCR, and RCB |
| SWOG S2206 (NCT06058377) phase III | Recruiting | Durvalumab plus neoadjuvant AC + paclitaxel followed by adjuvant ET | Stage II/III MP2/high2 | Invasive disease- free survival, pCR |

Need to determine who needs CDK4/6i vs. IO as unacceptably high rates of irAEs when combined

III. Ongoing research:

Q#1: Is all the IO benefit conferred with neoadjuvant administration?

SWOG 1418/NRG BR006

Pembrolizumab as adjuvant therapy for TNBC

- **Registration:**
 - Central PD-L1 testing
- **Stratification:**
 - Nodal stage ypNo vs ypN+
 - Residual tumor ≥ 2 vs < 2 cm
 - PD-L1 pos vs neg
 - Prior adjuvant chemo yes vs no

- **Hypothesis:**
 - Pembrolizumab reduces IDFS by 33% c/w observation alone
- **Primary Endpoint:**
 - Invasive DFS in PD-L1-positive and overall cohort
- **Secondary Endpoints:**
 - Toxicity
 - OS
 - DRFS
 - QOL (PROMIS, PRO-CTCAE forms, inflammatory markers)
 - Tissue banking

ALEXANDRA/IMpassion030

Pembrolizumab added to adjuvant chemotherapy for early stage TNBC

Eligibility

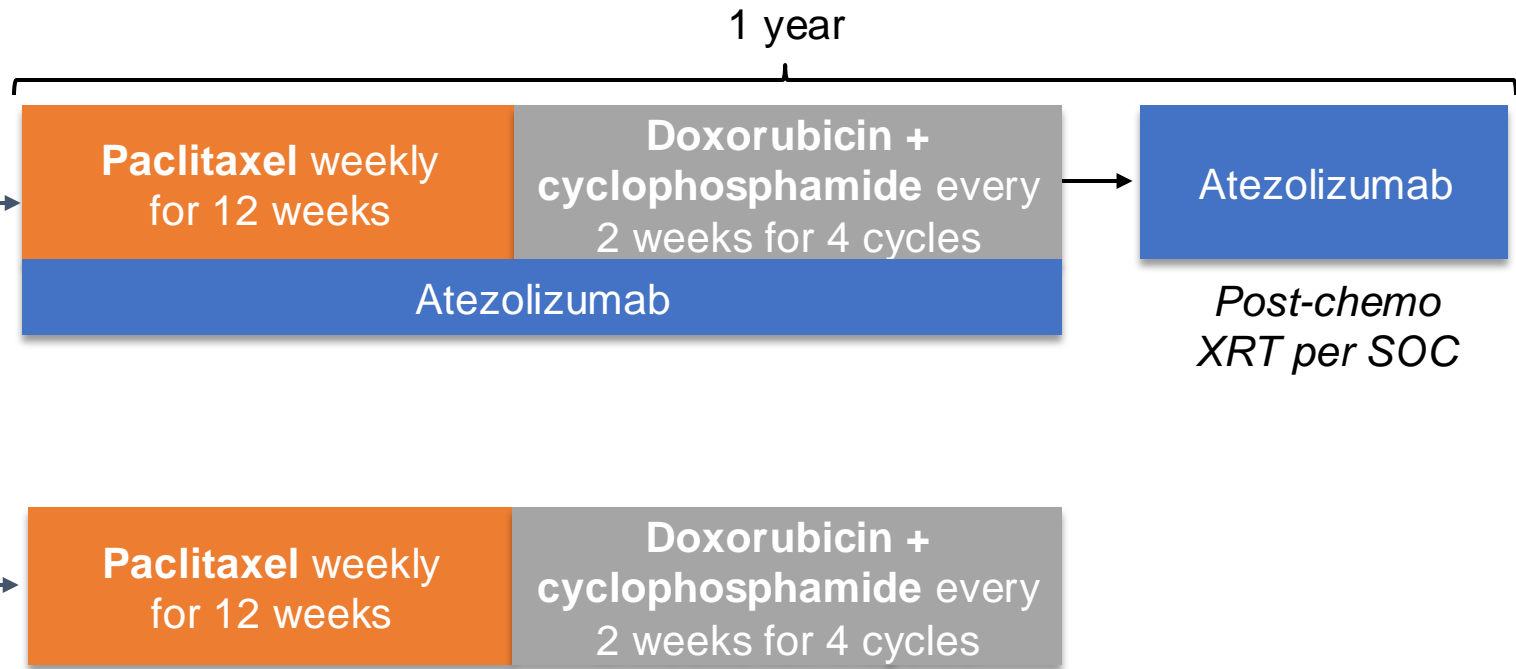

- **Adequately excised primary invasive TNBC (stage II/III)**
50:50 node negative/positive-enriched population

Stratification

- Axillary nodal status (0 vs 1-3 vs ≥ 4 positive lymph nodes)
- Surgery (breast conserving vs mastectomy)
- PD-L1 IC0 vs IC1/2/3

N = 2,300

R
1:1

- **Primary endpoint:** iDFS in ITT
- **Secondary endpoints:** iDFS PD-L1 IC1/2/3, OS, RFI, distant RFI, safety, and health-related QoL

Co-PIs: Ignatiadis, McArthur, Saji

NCT03498716

A-BRAVE - randomized phase 3 trial of adjuvant avelumab in high-risk TNBC

These data may represent an option for patients treated with neoadjuvant chemotherapy alone (without pembrolizumab) and who have invasive residual disease at surgery, and may benefit from adjuvant pembrolizumab

EFS by pCR

pCR Yes

Forgo adjuvant pembrolizumab?
Neoadjuvant chemo alone?
Chemo optimization?
Biologic combinations?

Need for upfront predictors!

Q#2: What is the optimal chemo partner for IO?

| Paclitaxel | | Nab-paclitaxel | |
|--------------------------|---------------------------|---------------------------|-------------------------|
| “Positive” | “Negative” | “Positive” | “Negative” |
| Keynote 522 ¹ | IMpassion131 ² | IMpassion130 ³ | Neotrip ⁴ |
| ISPY2 ⁵ | | IMpassion031 ⁶ | Geparnuevo ⁷ |

Q3: Is chemotherapy necessary for success of IO therapy in breast cancer?

Phase I: dose escalation cohort established
RP2D and acceptable AEs

Roussos Torres et al. (CCR, 2021)

Phase Ib: dose Expansion cohort in advanced breast cancer demonstrates efficacy

- ORR 40% in TNBC (N= 4/10)
- ORR 10% in Hormone receptor positive (N=1/10)
- Clinical benefit rate at 24 weeks: 40% overall (N= 7/20)

| Characteristics | N = 24* |
|--|------------|
| Age | |
| Median | 55 |
| Range | 38-77 |
| ECOG Performance Status | |
| 0 | 6 (25%) |
| 1 | 18 (75%) |
| Tumor type | |
| Hormone receptor-positive | 12 (50%) |
| Triple-negative (TNBC) | 12 (50%) |
| Median prior therapies | 6.5 (1-13) |
| Patients with evaluable disease for objective response | 20 |

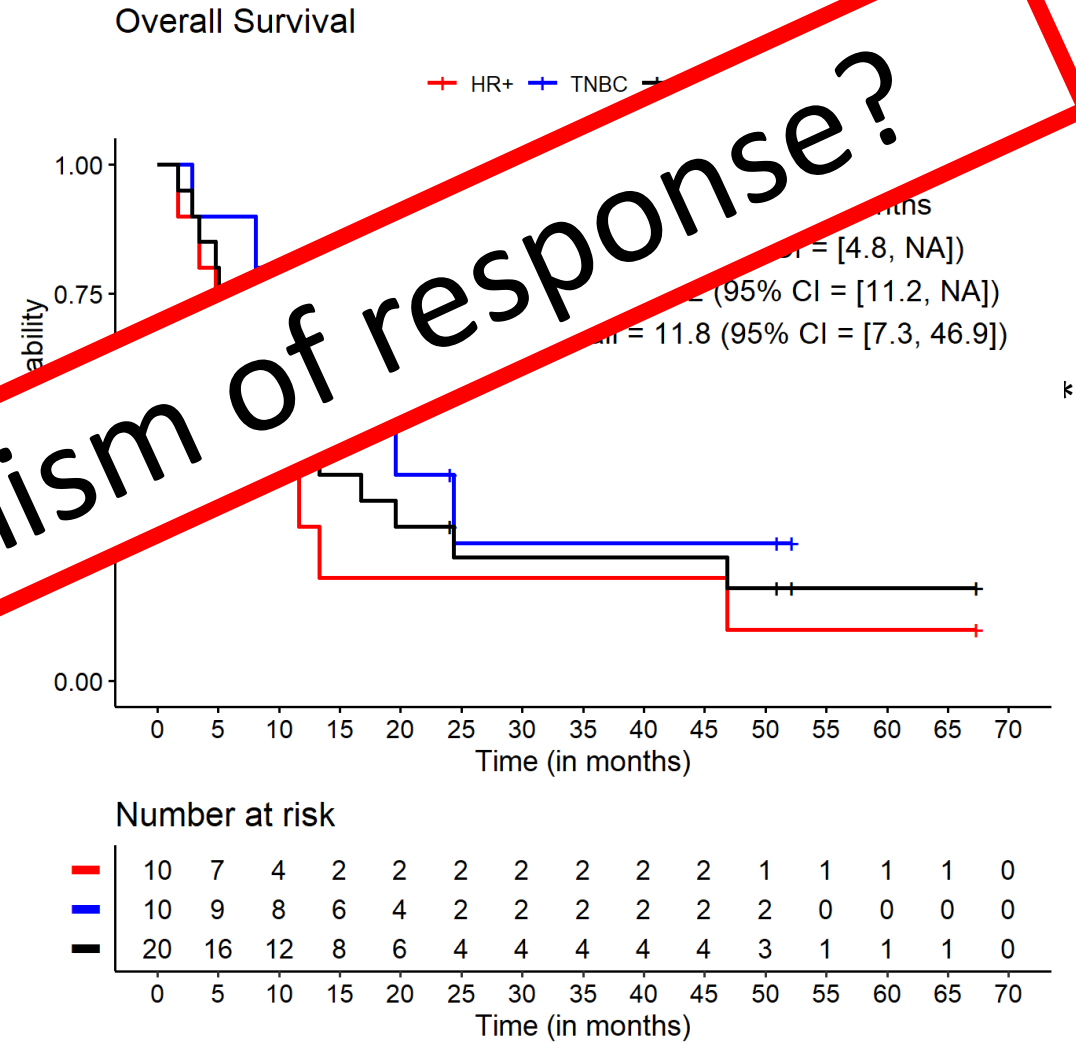

Roussos Torres et al. (Nature Cancer 2/2024)

PFS/OS rivals that achieved with chemo/pembro in PD-L1+ TNBC Keynote 355

Response is not correlated with PD-L1 status, TMB or TIL infiltration

PFS/OS rivals that achieved with chemo/pembro in PD-L1+ TNBC Keynote 355

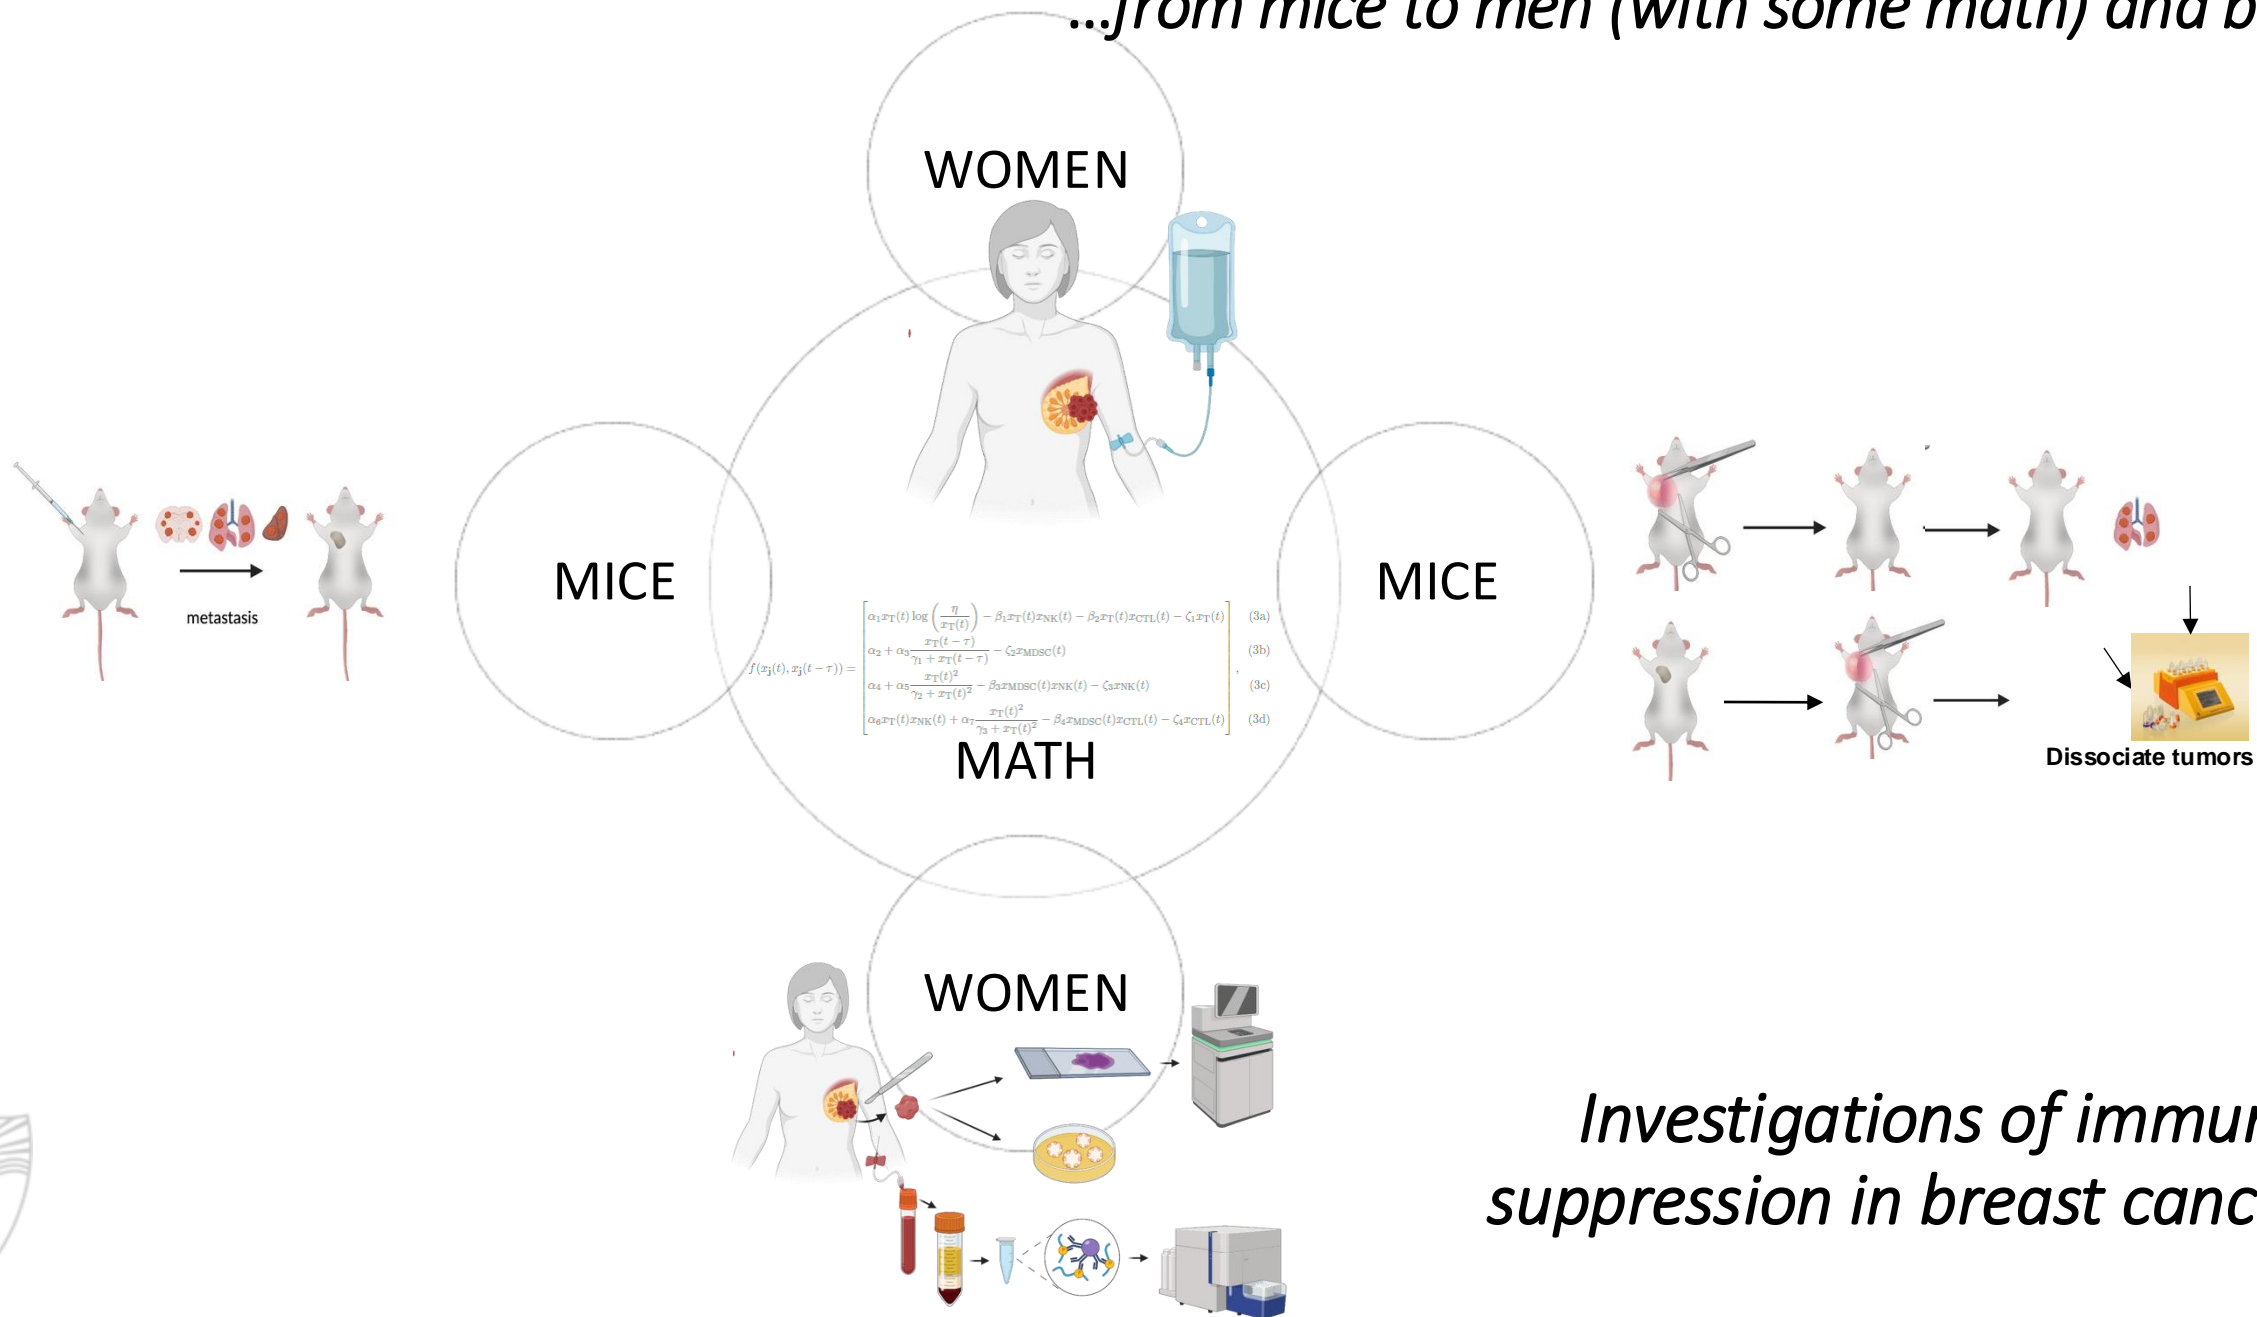

What is the mechanism of response?

Response is not correlated with PD-L1 status, TMB or TIL infiltration

Translational research approach in Roussos Torres lab

Investigations of immune suppression in breast cancer

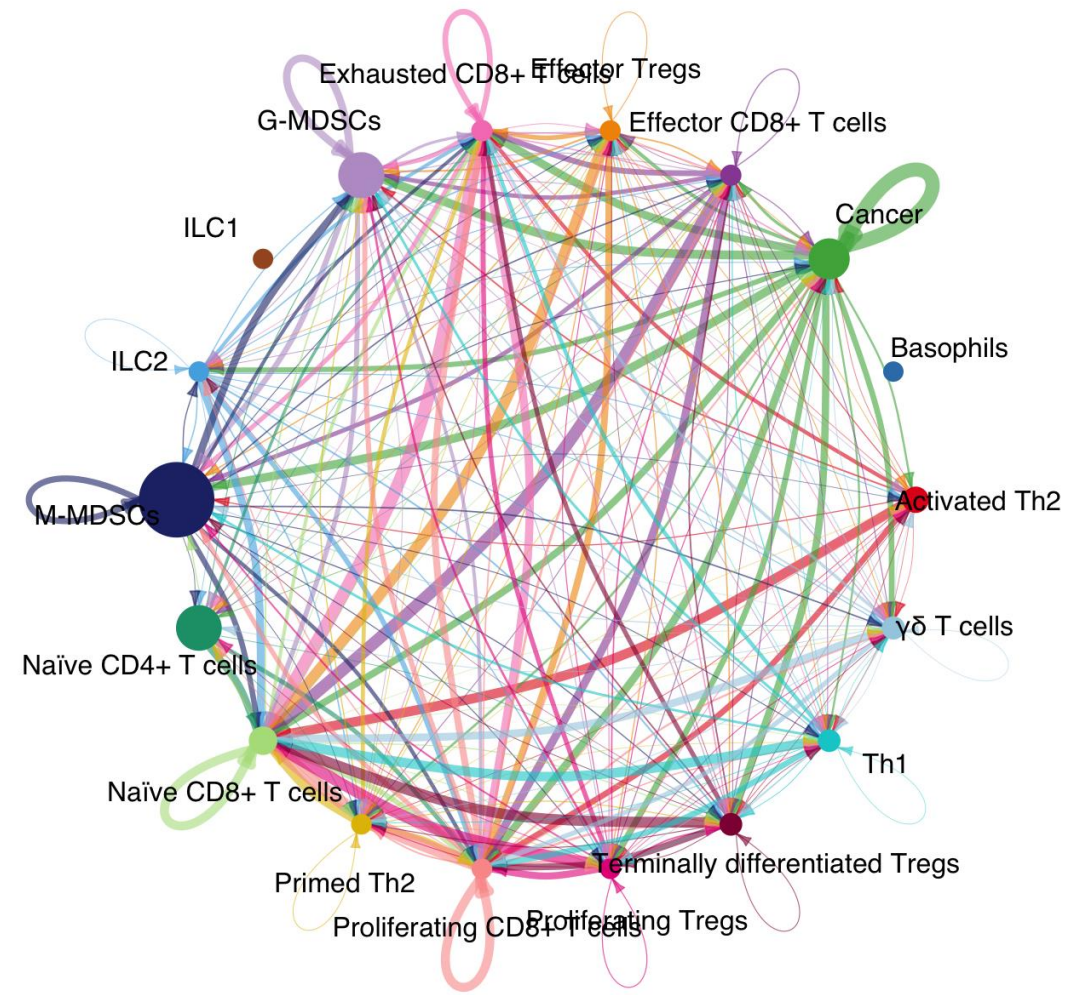

MICE: How do change in immune cells by treatment effect cellular interactions?

Number of interactions

Interaction weights/strength

...ligand/Receptor interactions by CellChat

MATH:

Mathematical modeling can account for how MDSC suppression affects metastatic disease progression

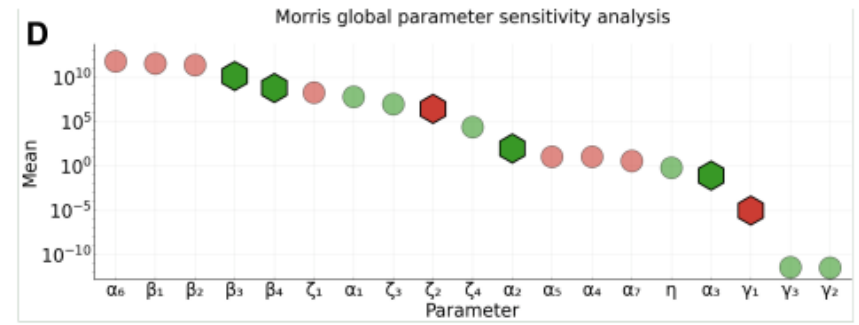

$$f(x_j(t), x_j(t-\tau)) = \begin{cases} \alpha_1 x_T(t) \log\left(\frac{\eta}{x_T(t)}\right) - \beta_1 x_T(t) x_{NK}(t) - \beta_2 x_T(t) x_{CTL}(t) - \zeta_1 x_T(t) & (3a) \\ \alpha_2 + \alpha_3 \frac{x_T(t-\tau)}{\gamma_1 + x_T(t-\tau)} - \zeta_2 x_{MDSC}(t) & (3b) \\ \alpha_4 + \alpha_5 \frac{x_T(t)^2}{\gamma_2 + x_T(t)^2} - \beta_3 x_{MDSC}(t) x_{NK}(t) - \zeta_3 x_{NK}(t) & (3c) \\ \alpha_6 x_T(t) x_{NK}(t) + \alpha_7 \frac{x_T(t)^2}{\gamma_3 + x_T(t)^2} - \beta_4 x_{MDSC}(t) x_{CTL}(t) - \zeta_4 x_{CTL}(t) & (3d) \end{cases}$$

$$\hat{x}_{MDSC} = \frac{\alpha_2(\hat{x}_T + \gamma_1) + \alpha_3 \hat{x}_T}{\zeta_2(\hat{x}_T + \gamma_1)} \quad (6a)$$

$$\hat{x}_{NK} = \frac{\zeta_2(\hat{x}_T + \gamma_1)(\alpha_4(\hat{x}_T^2 + \gamma_2) + \alpha_5 \hat{x}_T^2)}{(\hat{x}_T^2 + \gamma_2)(\alpha_2 \beta_3(\hat{x}_T + \gamma_1) + \alpha_3 \beta_3 \hat{x}_T + \zeta_2 \zeta_3(\hat{x}_T + \gamma_1))} \quad (6b)$$

$$\hat{x}_{CTL} = \frac{\zeta_2 \hat{x}_T(\gamma_1 + \hat{x}_T) h_1}{(\gamma_2 + \hat{x}_T^2)(\gamma_3 + \hat{x}_T^2) h_2} \quad (6c)$$

Kreger et al. (2023 CIR)

<https://doi.org/10.1101/2022.06.15.496246>

IV. Overall summary and conclusions

- Clearly there is activity of ICI in some patients, some (albeit few) can experience durable disease control
- Pembrolizumab + chemotherapy is approved for use in patients with TNBC
 - Neoadjuvant/ Adjuvant in combination with chemotherapy no PD-L1 testing needed
 - Metastatic patients with CPS score >10 (PD-L1 positive required)
- Considerations under investigation
 - What is most efficacious neoadjuvant vs. adjuvant checkpoint?
 - Non-traditional chemo approach used in trials (non-ddAC, +carbo, -capecitabine for RD), what is best chemo partner?
- Future directions: identify those likely to respond + develop rationale combinations and novel approaches
- Hormone receptor-positive/human epidermal growth factor receptor 2-negative BC (HR+/HER2- BC), HER2+ BC, and mTNBC in later lines of therapy, evidence is lacking to support the use of immunotherapy.
